Note of appreciation

Canada owes the success of its statistical system to a long standing co-operation between Statistics Canada, the citizens of Canada, its businesses, governments and other institutions. Accurate and timely statistical information could not be produced without their continued co-operation and goodwill.

Data in many forms

Statistics Canada disseminates data in a variety of forms. In addition to publications, both standard and special tabulations are offered. Data are available on the Internet, compact disc, diskette, computer printout, microfiche and microfilm, and magnetic tape. Maps and other geographic reference materials are available for some types of data. Direct online access to aggregated information is possible through CANSIM, Statistics Canada's machine-readable database and retrieval system.

How to obtain more information

Inquiries about this product and related statistics or services should be directed to:

Ordering/Subscription information

All prices exclude sales tax

Price: Canada: \$26.00 per issue, \$52.00 annually

Outside Canada: US\$26.00 per issue, US\$52.00 annually

Subscribers should order Catalogue 21-603-XPE to obtain an up-to-date set of the historical estimates, and subscribe to Catalogue 21-603-UPE to obtain bi-annual updates to be inserted into the binder. The updates are published twice each year (June and December).

Please order by mail, at Statistics Canada, Dissemination Division, Circulation Management, 120 Parkdale Avenue, Ottawa, Ontario, K1A 0T6; by phone, at (613) 951-7277 or 1 800 700-1033; by fax, (613) 951-1584 or 1 800 889-9734; or by Internet, at order@statcan.ca. For changes of address, please provide both old and new addresses. Statistics Canada products may also be purchased from authorized agents, bookstores, and local Statistics Canada offices.

Standards of service to the public

Statistics Canada is committed to serving its clients in a prompt, reliable and courteous manner and in the official language of their choice. To this end, the agency has developed standards of service which its employees observe in serving its clients. To obtain a copy of these service standards, please contact your nearest Statistics Canada Regional Reference Centre.

Symbols

The following standard symbols are used in Statistics Canada publications:

- .. figures not available
- ... figures not appropriate or not applicable
- nil or zero
- amount too small to be expressed
- x confidential to meet secrecy requirements of the Statistics Act.

This publication, Agriculture Economic Statistics, contains annual estimates for twelve agricultural economic indicators: net farm income, farm cash receipts, farm operating expenses and depreciation charges, the index of farm production, current values of farm capital (including value per acre of farm land and buildings), farm debt outstanding, the farm product price index, direct program payments, the production account, the balance sheet of the agricultural sector, the cash flow statement, and wage rates for hired agricultural labour.

This publication was prepared under the direction of:

- Paul Murray, Chief, Farm Income and Prices Section
(613) 951-0065, internet: paul.murray@statcan.ca
- Kimberley Boyuk, Head, Farm Cash Receipts Unit
(613) 951-2510, internet: kimberley.boyuk@statcan.ca
- Bernie Rosien, Farm Prices Unit
(613) 951-2441, internet: bernie.rosien@statcan.ca

The paper used in this publication meets the minimum requirements of "American National Standard for Information Sciences" - "Permanence of Paper for Printed Library Materials", ANSI Z39.48 - 1984.

DATA HIGHLIGHTS

Net cash income for 2001 rose for the second straight year to \$8.8 billion

Net cash income – the difference between a farmer's cash receipts and operating expenses – reached \$8.8 billion in 2001. Despite sharply higher costs of inputs such as feed and fertilizers, this increase was mainly due to a booming livestock sector and a marginal growth in crop receipts as farmers substantially reduce their grain and oilseed stocks.

Net cash income and total net income both increased in 2001

Farmers' net cash income rose 29.8% from 2000, as both cash receipts and operating expenses hit record highs. Net cash income increased for the second straight year, rebounding from annual declines during the late 1990s.

However, farmers drew heavily on their crop inventories to support sales in 2001 as grain and oilseed production was substantially reduced due to adverse weather conditions. As a result, year-end stocks of these crops were at levels not seen since 1989.

Cash receipts rose 9.7% to \$36.2 billion in 2001 – with increased receipts from the livestock sector being responsible for more than half the rise. Higher program payments – resulting from poor growing conditions and increased payments from various income disaster programs – accounted for almost 30% of the gain.

Operating expenses rose 4.4% to \$27.4 billion. Aside from higher fertilizer and feed costs, hikes in natural gas prices led to a jump in heating fuel expenses. Most provinces also saw increases in livestock purchases.

Net cash income can vary widely from one farm to another because of factors such as commodities produced, prices and weather. This is especially true for crop producers, who have been hit hard by low prices, as well as by drought or extremely wet conditions in many areas.

Provincially, net cash income rose in all provinces except Nova Scotia, where declining fruit receipts contributed to a 4.6% decrease.

Some provinces that reported declines in net cash income in 2000 recorded large percentage increases in 2001. For example, in New Brunswick, a 49.4% increase came on the heels of a 32.2% decline in 2000. Similar situations occurred in Newfoundland and Labrador, Prince Edward Island and Saskatchewan.

One-third increase in total net farm income in 2001

Total net farm income measures agriculture economic production by adjusting net cash income for value of inventory change, depreciation and income in kind.

Total net farm income rose 31.8% in 2001 with the increase in net cash income more than offsetting a large decline in the total value of inventory. Despite showing the largest increase since 1993, last year's level of \$3.7 billion was nevertheless 17.8% below its 1996 record.

The poor growing conditions in many parts of the Prairies and the rest of Canada contributed to very low levels of farm crop inventories by the end of 2001. Lower stocks of all major grains and oilseeds, except for corn, reduced the value of on-farm crop inventories by \$1.3 billion. Adverse weather in many areas of the Prairies reduced crop yields and forced farmers to use grain as feed earlier than usual as good pastureland quickly became scarce.

The impact of lower farmer-owned inventories was especially notable in Prince Edward Island and Saskatchewan, where total farm income fell despite strong increases in net cash income. In Prince Edward Island, a 39.0% decrease in potato production in 2001 contributed to a steep drop in the value of inventories. In Saskatchewan, the decline in farm inventories resulted in a 43.7% drop in total farm income. The 2001 level was 57.4% below the previous five-year average.

Cash receipts: Livestock revenues climb, crop receipts struggle upwards

Farmers received a total of \$36.2 billion from agricultural commodities and program payments last year. This was a 9.7% increase from 2000 and an 18.6% gain over the average for the previous five years from 1996 to 2000. Farm cash receipts rose in every province, the largest gain (+16.2%) in Manitoba.

Estimates of cash receipts reflect to a certain extent the impact of adverse weather during the 2001 growing season. However, the impact of crop production in 2001 on marketings will continue to be felt in the first six months of 2002.

For livestock producers, cash receipts rose in 2001 for the third straight year to a record \$18.9 billion, driven by higher revenues from cattle and hogs. This level was a 10.7% increase from 2000, and it was 25.4% above the previous five-year average.

Cash receipts from crops advanced a marginal 3.3% to \$13.6 billion, the first increase in four years. However, crop receipts remained 1.2% below the previous five-year average.

Cattle and calf receipts reached \$7.8 billion in 2001, up 14.5% from the record level of 2000. Higher sales abroad along with strong prices helped push receipts 35.7% above the previous five-year average.

Hog receipts, up for the third straight year, hit \$3.9 billion, 38.3% above the previous five-year average. Most of the 13.7 % increase in 2001 was due to revenue generated from domestic hog slaughter where both prices and marketings continued to rise. Aiding the overall increase was a 24.1% jump in receipts from hog exports, mostly to the United States.

There were also gains in receipts from the supply-managed sectors. Higher chicken prices and marketings pushed revenues to \$1.5 billion, up 10.7% from 2000 and well above the previous five-year average. In the dairy sector, revenues from milk and cream grew 2.8%, thanks to higher prices.

Crop receipts remained below the previous five-year average as lower deliveries for some major grains and oilseeds during the last half of 2001 offset higher prices. Farm stocks of major grains and oilseeds dwindled to very low levels by the end of 2001. They were 17.1% below the previous 10-year average, due primarily to the drought last summer.

Receipts for wheat excluding durum climbed to \$2.7 billion in 2001. However, revenues remained 6.4% below the previous five-year average, even though prices rose 13.6% and Canadian Wheat Board (CWB) payments increased 18.1%. Durum wheat receipts increased 22.8% largely because of higher CWB payments. Marketings were down for both durum and non-durum wheat.

Canola receipts grew 10.1% to \$1.7 billion, ending two years of declines but still short of the previous five-year average of \$2.0 billion. Marketings were down 7.5% from 2000 despite sales to China that contributed greatly to the rise in deliveries for the first half of the year. However, deliveries fell in the last two quarters as production hit its lowest point in 10 years.

Livestock receipts and payments rose, crop receipts struggled upwards in 2001

Barley receipts reached \$729 million, up 25.2% over 2000 and slightly above the previous five-year average. Tight supplies of feed barley in the western provinces helped drive up prices.

Farmers deferred \$863 million in crop receipts to 2002, up 47.4% from 2000 and 4.7% over the previous five-year average. A combination of higher prices for grains and oilseeds in 2001 and lower stocks at the end of that year may have caused producers to defer a larger portion of their crop receipts to 2002 in anticipation of reduced returns in the coming months.

Program payments jump as poor growing conditions, low prices, hit crops

Farmers received \$3.8 billion in program payments in 2001, up \$925 million from 2000. Most of this increase was the result of higher payments in crop insurance and income disaster programs. In addition, Ontario producers received \$190 million from one-time program payments designed to compensate them for income losses in 2000 because of inclement weather and severely depressed crop prices.

Crop insurance payments reached \$1.0 billion, up 71.1%, in response to the poor growing conditions in 2000 and 2001, and an increase in the acreage of crops insured.

Payments for income disaster programs reached \$627 million, up 48.4% from 2000. These include the Agricultural Income Disaster Assistance (AIDA) program, Canadian Farm Income Program (CFIP) and their related provincial disaster programs.

Higher livestock, fertilizer costs drive up operating expenses

Rising livestock expenses and fertilizer prices contributed to a 4.4% hike in total operating expenses last year to \$27.4 billion. During the previous five years, operating expenses had gone up 18.2%.

Prices of feed grains rebounded from recent lows, putting upward pressure on commercial feed prices. This – together with buoyant markets for beef at home and in the United States, the continued expansion of the hog sector in the Prairies, and the strong demand for chicken products – translated into a 12.6% rise in commercial feed expenses. The increased activity in the livestock sector also led to a 6.2% hike in livestock purchases and a 5.3% climb in expenses for artificial insemination and veterinary services.

A sharp rise in prices resulted in a 14.7 % increase in fertilizer expenses. Higher fertilizer prices were in part due to large price increases in natural gas, a major input to its production. Higher natural gas prices also contributed to a 23.4% increase in heating fuel expenses.

Machinery fuel prices stabilized in 2001 after increasing by more than 20% the previous year. However, machinery fuel expenses incurred by agricultural producers were still 12.0% higher than the previous five-year average.

Feed, fertilizer and heating fuel expenses soared in 2001

Farm debt outstanding increasing steadily

At December 31, 2001, farm debt outstanding rose 5.6% to \$40.8 billion continuing the steady upswing since 1993. Both mortgaged and non-mortgaged debt rose, by 7.9% and 3.6%, respectively. Since 1994, non-mortgaged debt has contributed more to the total debt than mortgaged debt. In 2001, non-mortgaged debt rose to \$20.7 billion, while mortgaged debt rose to \$20.0 billion.

Most non-mortgaged debt was owed to chartered banks (64.2%) and credit unions (23.4%). Major holders of mortgaged farm debt were Farm Credit Canada (32.7%), chartered banks (25.3%), private individuals (13.6%), credit unions (7.5%) and provincial government agencies (6.8%).

Farm debt in Canada has increased 23.4% over the previous five-year average. In 2001, all provinces increased their debt load. Increases ranged from 2.8% in Saskatchewan to 15.8% in Newfoundland.

Banks held almost half of the farm debt in Canada in 2001

Farm debt in Canada increased 23.4% over the previous five-year average. In 2001, all provinces increased their debt load. Increases ranged from 2.8% in Saskatchewan to 15.8% in Newfoundland.

Value of farm capital increased in most provinces

Canada's farm capital value continued its upward climb, increasing by 1.7% to \$188.5 billion. This marked the ninth consecutive year of increases. In 2001, total farm capital increased 9.4% above the previous five-year average.

Total farm capital value trending upwards

Quebec accounted for the largest increase in total capital value, rising 5.7%, while British Columbia remained unchanged and Saskatchewan recorded the largest decrease of (-1.2%).

The value of land and buildings, which accounted for 73.8% of total farm capital value, rose 1.2% from the 2000 level to \$139.2 billion. The total value of land and buildings was 8.5% above the previous five-year average. The value per acre for Eastern Canada and Western Canada averaged \$2,174 and \$530 respectively.

The value of machinery and equipment, which accounted for 17.0% of total farm capital, increased slightly to \$32.0 billion. The value of tractors, combines and other farm machinery, the largest component (80.0%) of the value of machinery and equipment increased 1.2%, while trucks increased 3.8% and autos were almost unchanged. In 2001, the value of machinery and equipment rose 6.0% above the previous five-year average.

The value of livestock and poultry, which accounted for 9.2% of total farm capital value, increased 6.2% to \$17.3 billion. Cattle and calves, the largest component (87.8%) of the value of livestock and poultry, increased 5.4% to \$15.2 billion from 2000, and 25.7% above the previous five-year average. The value of pigs, which represented 9.2% of the total value of livestock and poultry, increased 15.1% to \$1.6 billion from 2000, and 24.0% above the previous five-year average. The value of poultry increased 6.8% to \$352.2 million.

Farm sector equity up 0.6% in 2001

Farm sector equity in Canada increased 0.6% in 2001, to a record level of \$165.3 billion. Equity rises when asset values increase more rapidly than farm debt. From December 31, 2000 to December 31, 2001, total farm assets rose \$2.9 billion to \$201.0 billion, while total liabilities increased \$1.9 billion to \$36.3 billion. After declining every year from 1981 to 1986, the agriculture sector equity (in current dollars) has grown annually, except in 1991.

Total assets of the farm sector at December 31, 2001 were up 1.4% from a year earlier. Values were up for all types of assets except for inventories. The decline in inventories was led by poultry and market livestock, followed by inputs and crops. Quota, which represented 10.4% of total farm assets, was the largest contributor to the increase. Quota rose 12.8% from the previous year, the largest percentage increase of all asset categories. Farm real estate, which represents 59.7% of total farm assets, was almost flat at a 0.2% increase; however it remained 6.3% above the previous five-year average.

Total assets, total liabilities and equity, at December 31
Canadian agricultural sector, 1981 to 2001
 (in current dollars)

Farm liabilities at the end of 2001 reached \$36.3 billion, up 5.6% from the previous year. This increase followed rises in total farm liabilities of over 7.0% from 1997 to 2000, the largest consecutive annual increases in the 1981 to 2000 period. Current liabilities rose 5.3%, compared to 5.7% for the long-term liabilities.

The debt-to-asset ratio, which measures the dependence of farm businesses on debt, was 18.1% in 2001, compared with 17.4% in 2000. During the last twenty years, debt-to-asset ratio ranged from a low of 12.4% in 1981 to a high of 18.8% in 1986.

Value of production continued to climb in 2001

The value of agricultural production reached a record high of \$45.5 billion in 2001, up 5.8% from 2000. With the exception of a small drop in 1997, the value of agricultural production (in current dollars) has been increasing each year since 1991. The average annual increase from 1991 to 2001 was 6.9% compared to 2.2% for the period 1981 to 1991.

Sales of agricultural products in 2001 stood at \$40.4 billion. Other major sources of income were program payments (\$3.8 billion) and custom work receipts (\$1.8 billion).

Sales of agricultural products to other sectors increased 7.6% to \$32.3 billion from 2000 to 2001, as producers reduced farmer-owned inventories by \$1.1 billion. Sales of agricultural products to other farms made up 20.2% of all agricultural product sales in 2001, rising 3.2% to \$8.2 billion.

Fourth straight increase in net value added

Net value added (the value of production less input expenses, business taxes and depreciation) increased 9.2% in 2001 to a record high of \$10.8 billion.

Distribution of net value added, Canada, 2001

Net value added in 2001 was distributed as follows:

- \$1.1 billion in land rental to non-operators,
- \$2.4 billion in interest charges,
- \$2.0 billion in non-family wages,
- \$1.4 billion in family wages,
- \$3.3 billion in unincorporated operator returns,
- \$547 million in corporation profits.

Farm business cash flows increased in 2001 to a record high

Farm business operators had more cash available for investment or withdrawal in 2001. Compared to 2000, cash flows increased 15.6% to \$12.3 billion, well above the previous five-year average of \$10.1 billion.

Cash flows increased in 2001 mainly because cash income rose with producers' cash sources growing faster than cash uses. Cash sources rose 9.5% to \$37.8 billion in 2001 as sales of primary production (mainly livestock) and program payments increased.

Cash available to producers was further expanded through borrowing. The net change in loans outstanding reached \$1.9 billion in 2001. Although the net change in loans outstanding was positive, the increase was the smallest since 1996. Much of the net increase in loans outstanding in 2001 was in long-term liabilities (80.0%). This contrasts with 1998 and 1999 when long-term liabilities accounted for about 58% of the net change in loans outstanding.

The largest percentage increases in cash flows between 2000 and 2001 occurred in Newfoundland (+107.1%), Manitoba (+47.3%), Saskatchewan (+41.0%), Alberta (+27.5%), and New Brunswick (+25.9%). Nova Scotia (-10.8%) and Quebec (-6.2%) showed the largest percentage decreases. Some provinces that reported increases in cash flows in 2001 recorded large percentage decreases in 2000. For example, in Newfoundland, a 107.1% increase came on the heels of a 49.0% decline in 2000. Similar situations occurred in Manitoba (-12.8% in 2000), New Brunswick (-11.4% in 2000) and Saskatchewan (-8.6% in 2000).

More cash available for investment or withdrawal in 2001

Farm Product Price Index – 2001

Prices farmers received for their agricultural commodities increased 6.1% in 2001 from 2000. The crop index rose 7.4% from 2000, the first annual increase since a 4.9% rise in 1996. Prices farmers received for

all livestock and animal products climbed 5.0% above year-earlier levels, extending the annual growth to three years.

The Farm Product Price Index (FPPI 1997 = 100) stood at 101.1 for 2001.

The 2001 annual crop index was 90.9, the highest annual level since 1998. There was a year-over-year increase in all of the crop sub-indexes except for the fruit index, which fell 2.9%.

Of the crop sub-indexes, the specialty crops index recorded the highest annual increase, up 23.1% from 2000. The oilseed and the grain indexes followed with 14.6% and 7.7% increases, respectively. This was the first year these indexes rose since 1996 as grain and oilseed prices had come under intense pressure due to abundant world supplies.

The potato index rose 6.4% in 2001 to a record level of 127.2. Expansion in domestic processing to fuel North America's growing demand for processed potato products (french-fries) and reduced production in 2001 contributed to higher prices.

The index for livestock and animal products was 110.9 in 2001. All of the livestock sub-indexes recorded increases from 2000, ranging from a 2.0% increase in the dairy index to a 6.7% rise in the hog index.

The index for hogs stood at 94.4 in 2001, the highest annual level since 1997. Hog prices increased on strong demand for pork both domestically and internationally. They had been volatile over the last few years, spurred by fluctuating production and slaughter capacities. The monthly index series shows that the hog index had plummeted from a peak of 114.4 in July 1997 to 30.1 in December 1998, but has since regained most of that loss.

The annual index for cattle and calves has increased every year since 1996 and continued the trend in 2001 by rising 6.2% from 2000. Growth in demand for beef, both domestically and internationally, has supported prices.

NET CASH INCOME COMPARISON

The net cash income estimates published in the *Agriculture Economic Statistics* binder (Statistics Canada, cat. 21-603XPE) are the official Statistics Canada (SC) estimates. Other estimates of net cash income (farm cash receipts less operating expenses) can be derived from the SC Agriculture Division *Taxation Data Program* (PDF), the *Farm Financial Survey* (FFS, Statistics Canada, cat. 21F0008XIB) and the *Census of Agriculture* (CEAG). It is important to understand data sources, coverage and conceptual differences when comparing data collected for different purposes. Adjustments are required to make these estimates comparable.

1. Sources:

a) *Agriculture Economic Statistics* (AES)

The highest-profile series of measures of net cash income are published in the AES binder. The net cash income series measures the aggregate earnings of all agricultural businesses from the production of agricultural goods at the provincial and national level. Annual estimates are established from a wide variety of surveys or administrative data on crop and livestock production and inventories, quantity marketed, average farm prices, program payments, expenses items and rebates. For some variables, CEAG, TDP and FFS estimates are used either as benchmark or indicators.

b) *Taxation Data Program* (TDP)

The TDP estimates a range of financial variables, including revenue and expenses from samples of approximately 70,000 tax filer records of both incorporated and unincorporated farms. The TDP publishes annual average estimates by farm type, sales classes and sub-provincial regions.

The TDP publishes information representing all individual tax filers who reported total farm operating revenues of \$10,000 or more on their income tax return and agricultural corporations reporting total farm operating revenues of \$25,000 and over, and for which 51% or more of their sales come from agricultural activities. Data on unincorporated farms reporting total operating revenues below \$10,000 is available but are not included in the TDP publication because of the lower quality of these estimates.

c) *Farm Financial Survey* (FFS)

The biennial FFS is another source of financial information collected from a sample of about 18,000 farms. The sample includes both incorporated and unincorporated farms with annual sales from agricultural activities exceeding \$10,000 (\$2,000 prior to 1998). This survey collects total gross receipts from program payments and the sales of agricultural products grouped by major categories (e.g., grains and oilseeds, horticulture) as well as total expenses (excluding depreciation) along with detail on interest expenses, wages, crop insurance and NISA contributions. The FFS program produces average estimates of primarily financial balance sheet items including details on income and expenses at the provincial level by sales class and farm type.

d) *Census of Agriculture* (CEAG)

Every five years, the CEAG collects a wide variety of data, including total gross farm receipts and operating expenses by category, on all farm operations in Canada producing agricultural products with the intention of selling them. The CEAG publishes estimates of total gross farm receipts and operating expenses by farm type, sales classes and sub-provincial regions.

2. Conceptual Differences

a) *Agriculture Economic Statistics (AES)*

AES estimates include all agricultural businesses. These data are not available by farm type, sales classes, sub-provincial regions or at the micro level.

Receipts and expenses are estimated by calendar year. They are recorded on a cash basis when the money is paid to or disbursed by the farmer.

AES receipts and expenses exclude:

- ♦ income earned from non-agricultural use of the farm (e.g., income from tourism activities on farm);
- ♦ income that farm operators or their families receive from other sources (e.g., wages and salaries, and investment income);
- ♦ revenue or expenses from the sale or purchase of farm capital (real estate, machinery and equipment), although the interest paid on these purchases is included as an expense;
- ♦ capital payments where funds do not relate to current production and transfer payments (such as training allowances) directed to individuals;
- ♦ unlike the *TDP*, *FFS* and *CEAG*, AES estimates exclude farm-to-farm transactions, unless they occur across provincial or national borders. Within a province, sales from one farm are considered an expense to another, thus offsetting each other.

b) *Taxation Data Program (TDP)*

The *TDP* estimates represent all individual tax filers who reported total farm operating revenues of \$10,000 or more on their income tax return and agricultural corporations reporting total farm operating revenues of \$25,000 and over, and for which 51% or more of their sales come from agricultural activities.

Some non-farmers may be present on the *Tax base* (e.g., someone reporting farm income from a crop share agreement but not involved in a farming operation).

The estimates are published on a calendar year basis and no attempt is made to adjust data from agricultural corporations reporting data on a fiscal year that may not coincide with a calendar year.

The *TDP* "Total Operating Revenues" includes "Custom Work and Machine Rental" and "Rental Income" which are not included in the AES farm cash receipts. However, AES "Custom Work and Machine Rental" represent a "net" expense (the difference between custom work expenses and receipts). For example, earned income from custom work done by farmers outside their operation is deducted from the amount they paid to other custom work operators for other types of custom work done on their operation. AES "Rent" expenses are also treated in the same manner as a "net" expense.

c) *Farm Financial Survey (FFS)*

The sample includes both incorporated and unincorporated farms with annual sales from agricultural activities exceeding \$10,000 (\$2,000 prior to 1998). Like the *TDP*, no adjustment is made to agricultural corporations reporting data on a fiscal year that may not coincide with the calendar year period.

The *FFS* "Total Gross Farm Receipts" includes agricultural custom work receipts that are not directly accounted for in the AES farm cash receipts. The treatment of "custom work" is similar to the *TDP*.

d) *Census of Agriculture (CEAG)*

The *CEAG* collects data from any farm operation producing agricultural products with the intention of selling them. Data are generally provided on a calendar year, or for a complete fiscal year.

Unlike *AES* receipts and expenses, *CEAG* data include dividends received from co-operatives, Goods and Service Tax (GST) refunds, custom work receipts, GST paid and rebates received.

3. Comparison of estimates

Conceptual and methodological differences and data collection methods make direct comparisons impossible between *AES* receipts or expenses series with total income or expenses derived from *TDP*, *FFS* or *CEAG* data. The exclusion of farm-to-farm transactions within a province in the *AES* and the fact that these farm-to-farm transactions are not identified with the *TDP*, *FFS* and *CEAG* is the main reason making the comparison difficult. However, net cash income estimates (farm cash revenues less operating expenses) are more directly comparable since, within a province, sales from one farm is an expense to another farm, thus offsetting each other.

Similar to farm-to-farm sales, no adjustment is required to remove the *TDP* "Custom Work and Machine Rental", *FFS* "Agricultural Custom Work", and *CEAG* "Custom Work" from the receipts since the receipts and expenses offset each other in the net cash income calculation. The same rationale can be applied to the way GST or the *TDP* "Miscellaneous Revenue" and "Miscellaneous Farm Expenses" are handled. Within a province, many items would cancel each other out when deriving net cash income estimates.

The *TDP* publishes average receipts and expenses only for farms reporting total farm operating revenues of \$10,000 or more on their income tax return and agricultural corporations reporting total farm operating revenues of \$25,000 and over, and for which 51% or more of their sales come from agricultural activities. For the comparison, estimations for the unincorporated farms reporting total operating revenues below \$10,000 were included in spite of the lower quality of these estimates.

No attempt is made to estimate incorporated or unincorporated farms with annual sales from agricultural activities lower than \$2,000 in the *FFS*. This could have been done using 1995 data from *CEAG* as a benchmark to represent the contribution of these farms to total receipts and expenses. The disadvantage of this method is that as one moves away from the benchmark year, the quality of the estimate becomes less representative of reality.

4. Results

a) Net cash income comparison - Total, 1995.

Canada	5,949,438	5,093,296	6,462,671	5,740,429

(1) Covers all agricultural holdings.

(2) Adjusted to include unincorporated farms with total farm operating revenues lower than \$10,000. Does not include agricultural corporations with total operating revenues below \$25,000.

(3) Covers both incorporated and unincorporated farms with annual agricultural sales exceeding \$2,000.

b) Net cash income comparison – Absolute and relative differences, 1995.

Province	Absolute Difference			Relative Difference		
	(TDP-AES)	(FFS-AES)	(CEAG-AES)	(TDP-AES)/AES	(FFS-AES)/AES	(CEAG-AES)/AES
	'000 of dollars			(%)		
Newfoundland	336	1,340	3,490	5.7	22.9	59.6
Prince Edward Island	-11,841	-6,660	-10,380	-16.5	-9.3	-14.4
Nova Scotia	-10,012	-11,440	12,301	-17.4	-19.8	21.3
New Brunswick	-7,451	-2,918	6,732	-18.0	-7.0	16.3

Alberta	-437,229	-136,219	-161,739	-30.6	-9.5	-11.3
British Columbia	-79,945	165,500	-19,647	-34.0	70.5	-8.4
Canada	-856,142	513,233	-209,009	-14.4	8.6	-3.5

5. Conclusion:

Comparing data collected for different purposes is not an easy task. It is almost impossible to identify precisely what causes the discrepancies at the aggregate level. There will be always discrepancies due to differences in coverage, accounting methods and period, edit, imputation and estimation methods of the survey, census or administrative data. Further work is required at the micro level to assess if responses to a survey, Census or tax form are different.

NOTES ON FARM CASH RECEIPTS**Canada Total**

Excludes Newfoundland prior to 1972.

C.W.B.

Canadian Wheat Board

Wheat excluding Durum, Durum Wheat, Oats and Barley, C.W.B. Payments

Represents interim, adjustment and/or final payments made directly to producers by the Canadian Wheat Board or the Ontario Wheat Producers' Marketing Board.

W.G.S.A. Payments

Represents payments received by participating producers under the Western Grain Stabilization Act.

Gross Revenue Insurance Plan (GRIP)

The Gross Revenue Insurance Plan (GRIP) was established in 1991 under the Farm Income Protection Act. GRIP builds on crop insurance by providing producers with revenue protection by offering price support in addition to yield protection. Payments are made when a producers market revenue falls below a predetermined target revenue. In 1991, grain and oilseed and speciality crop producers were eligible to participate in GRIP.

Net Income Stabilization Account (NISA)

The Net Income Stabilization Account (NISA) was established in 1991 under the Farm Income Protection Act. Under the terms of the program individual producer accounts were established. On a tax year basis payments are calculated in accordance with predetermined triggering mechanisms. In 1991, the program applied to grains and oilseeds, including farm fed grain and edible horticulture crops not covered under the National Tripartite Stabilization Program.

Crop Insurance Payments

Represents payments made to participating producers under the Crop Insurance Act and private hail insurance plans.

Provincial Stabilization Programs

Represents payments received by participating producers from provincial income or price stabilization programs.

Dairy Subsidy

Includes payments made under the Canadian Dairy Commission Act to all industrial milk and cream producers. Payments are made on industrial milk and cream shipments within Canadian requirements.

ASA - Price Stabilization

Represents payments made to producers under the price stabilization component of the Agricultural Stabilization Act (A.S.A.).

ASA - Tripartite Plans

Represents payments made to participating producers under the various tripartite stabilization plans of the Agriculture Stabilization Act.

Other Payments

Includes payments made to producers under various federal, provincial and joint federal/provincial programs. Generally these are ad hoc programs established to deal with unusual climatic and/or economic conditions in the agriculture sector.

Total Livestock Receipts

Beginning with 1986, Total Livestock Receipts include receipts from the sale of horses and embryos, which are not explicitly listed in the table.

NOTES ON FARM OPERATING EXPENSES AND DEPRECIATION CHARGES

Canada Total

Excludes Newfoundland prior to 1972.

Rebates

All estimates are net of any direct federal or provincial government rebates paid directly to producers.

Property Taxes

Includes taxes on owned land and buildings only.

Gross Farm Rent

Includes cash rent and share rent.

Wages to Agricultural Labour

Only total estimate available from 1926 to 1957.

Interest on Indebtedness

Includes payments on farm mortgages for owned land and buildings, together with interest payments on all other farm business debts.

Total Machinery Expenses

Only farm business expenses are included. From 1926 to 1950, total includes tractor expenses, truck expenses, engine and combine expenses, automobile expenses, machinery repair parts, and machine shop and blacksmith expenses. From 1951, two components are published: 1) gasoline, diesel fuel and lubricants, and 2) machinery repairs and other machinery expenses.

Fertilizer and Lime

Includes fertilizer only from 1926 to 1940.

Other Crop Expenses

Includes pesticides, seed and seedlings, and twine, wire and containers from 1926 to 1937, plus irrigation from 1938. From 1941 to 1947, the sum of the components of other crop expenses differs from total other crop expenses estimates for some Atlantic provinces.

Pesticides

Includes pesticides and containers from 1926 to 1947. From 1948, only pesticides included.

Seed and Seedlings

Includes purchases through commercial channels only. From 1926 to 1972,

includes seed and seedlings and nursery stock. From 1973, only seed and seedlings included. Since 1973, farmers' purchases of nursery stock have been deducted from nursery stock receipts in the farm cash receipts account.

Irrigation

Estimates are available from 1938.

Twine, Wire and Containers

Includes binder twine only from 1926 to 1944. Binder twine, baler twine and wire are included from 1945 to 1947. From 1948, - binder twine, baler twine, wire and containers are included. Containers are included in the pesticides estimate from 1926 to 1947.

Feed

Includes purchases through commercial channels only.

Other Livestock Expenses

Included in miscellaneous from 1926 to 1940.

Repairs to Buildings

Includes the farm business share of repairs to farm buildings and residences.

Electricity and Telephone

Includes farm business expenses only. Before 1941, electricity included in miscellaneous. From 1941 to 1950, includes electricity only.

Miscellaneous

Includes: fence repairs from 1926, net custom work expenses from 1951, the farm business share of heating fuel expenses from 1971, stabilization levies from 1975, and other supplies and services not elsewhere specified from 1926. Also includes insurance expenses, which were estimated from 1951 to 1970 by summing net property, crop and hail insurance expenses. Since 1971, net property insurance premiums, net hail insurance premiums and gross crop insurance premiums have been summed to estimate insurance expenses. Crop insurance indemnities have been included in the cash receipts account since 1971.

Total Depreciation

Includes estimates of the farm business share of depreciation charges on buildings, cars, trucks and other farm machinery.

**INDEX
OF
FARM PRODUCTION**

OF FARM PRODUCTION 1985

1985 the index of farm production in Canada rose 7.3%, after two consecutive over-year declines. The index of farm production (1981=100) now stands at 102.6.

Production increased 15.0% in 1985 and almost entirely responsible for the rise in the index of farm production. A large increase in crop production offset a drought-reduced crop in 1984 (the total crop index was the lowest for the five years). Several factors contributed to the increase in 1985.

Crop production rose 20.5% due to increases in area and yields for wheat, oats, barley and corn in 1985. Despite the increase, grain production index, at 92.2, was lower than the levels established from 1981 to 1983.

Oilseed production increased by 9.5% as the output of canola-rape seed, flaxseed and soybeans rose. Oilseed production reached a record level in 1985 and was 82.9% above the 1981 level. Production of oilseeds has increased every year since 1981 except for a drop in 1983.

The drought that affected the Prairie provinces in 1985 was generally less severe than the drought that took place in 1984.

Vegetable production increased 3.2% led largely by a 6.9% increase in potato production. For potatoes, both planted area and yields were up in 1985. The indexes for fruits and other crops also registered increases in 1985.

The production of livestock and animal products increased 0.4% in 1985. The index of livestock and animal products now stands at 102.3 and has risen moderately for three consecutive years.

Livestock production (cattle, calves, hogs, sheep and lambs) rose 0.6% with production of cattle and calves up 3.8%. Despite this increase, production of cattle and calves was 4.1% below the 1981 level and 6.9% below the record set in 1975. Hog and lamb production fell 3.7% and 5.2%, respectively.

Dairy production decreased 2.4% despite higher fluid milk deliveries. Industrial milk and cream marketings decreased 4.3% as producers cut back on deliveries during the early part of 1985 to stay within their quota allotments for the 1984/85 dairy year (August-July). In addition, the dairy quota for industrial milk was lowered on August 1, 1985 leading to further cutbacks in industrial milk deliveries.

A 4.8% increase in the poultry and egg index was the result of increased production of broilers and turkeys as producers expanded output to meet increased production quotas. Production of poultry and eggs has been rising annually since 1981 and the poultry and egg index now stands at 111.6.

The index of farm production increased in seven of ten provinces in 1985. The largest increase, 22.2%, was in Manitoba while the largest decrease in production was in Prince Edward Island, a drop of 6.7%.

TECHNICAL NOTES ON THE FARM PRODUCT PRICE INDEX

As of March 1990, the index was rebased to 1986=100. The weighting period of 1981-1984 was maintained, and the commodities included in the index remained unchanged from those included in the 1981=100 index.

When the index was rebased to 1981=100 in December 1986, certain new commodities were added and several old commodities were disaggregated so that more narrowly defined price movements could be followed. Also, with this rebasing, Newfoundland was included in the index beginning in January 1981.

The present index has four weighting periods for approximately forty years of data. The index has been completely rebased in terms of time, weight and coverage about every ten years. This ensures that the quantity weights reflect current production patterns. The multi-year weighting period used in the current index provides more representative weights than a single year weighting period. As noted above, the most recent rebasing was in terms of base time period only, as the weighting period and coverage are considered to still be representative of current production patterns.

Since Newfoundland was not included in the index prior to 1981, a break in the Canada series occurs in that year. Nevertheless, Newfoundland's agricultural production is relatively small and the break is not significant.

FOOTNOTES ON "DIRECT PROGRAM PAYMENTS"

PREPARED: JUNE/89

1. Crop Insurance reflects the indemnities and premiums under the "Crop Insurance Act" only. Payments and producer premiums under private hail insurance are not included as is the case in the "Farm Cash Receipts" and the "Operating Expenses after Rebates" series.
2. Ontario "Provincial Stabilization Program" reflects the gross payments triggered and the premiums paid by producers during the year. These data differ from those in the "Farm Cash Receipts" and the "Operating Expenses after Rebates" series where only the actual disbursements are reflected.

EXPLANATORY NOTES ON DIRECT PROGRAM PAYMENTS TO PRODUCERS

Payments Enhancing Receipts

Agricultural Stabilization Act (A.S.A.) - Price Stabilization

The A.S.A., enacted in 1958, provides payments to producers in every province during periods of low commodity prices. Payments are made whenever the average market prices of commodities covered under the Act fall below calculated support prices. Mandatory support is provided for cattle, hogs, lambs and wool; industrial milk and industrial cream; corn and soybeans; and spring wheat, winter wheat, oats and barley not produced in the designated area of the Canadian Wheat Board. Other commodities may be designated for support by the Governor in Council.

Agricultural Stabilization Act (A.S.A.) - Tripartite Plans

Under an amendment to the A.S.A., in 1985, stabilization plans can be established on a commodity basis. Each commodity stabilization plan provides for price stabilization according to pre-set formulae. Payments are made to producers whenever market prices fall below the stabilization price. By September 1987, plans had been established in various provinces for the following commodities: slaughter cattle, feeder cattle, feeder calves, hogs, lambs, white beans, coloured beans, sugar beets and apples. Starting in 1999, payments under this program (mainly recoveries of overpayments) are included in the Other Payments category.

Crop Insurance

The Crop Insurance Act, enacted in 1959, makes available to farmers, in every province, all-risk crop insurance.

Dairy Subsidy

Under the Canadian Dairy Commission Act, enacted in 1966, producers in every province except Newfoundland are paid subsidies on shipments of industrial milk and cream that do not exceed Canadian requirements.

Gross Revenue Insurance Plan (GRIP)

The Gross Revenue Insurance Plan (GRIP) was established in 1991 under the Farm Income Protection Act. GRIP builds on crop insurance by providing producers with revenue protection by offering price support in addition to yield protection. Payments are made when a producer's market revenue falls below a predetermined target revenue. In 1991, grain and oilseed and speciality crop producers were eligible to participate in GRIP. Starting in 1999, payments under this program (mainly recoveries of overpayments) are included in the Other Payments category.

Income Disaster Assistance Programs

This category includes the Agricultural Income Disaster Assistance (AIDA) program, its related provincial disaster programs and beginning in 2001, the Canadian Farm Income Program (CFIP). These programs are designed to provide funding for Canadian agricultural producers to cushion extreme income reductions beyond their control.

The AIDA-related provincial programs are:

- Agricultural Disaster Insurance Program (ADIP), Prince Edward Island
- Ontario Whole Farm Relief Program (OWFRP), Ontario
- Farm Income Disaster Program (FIDP), Alberta
- B.C. Whole Farm Insurance Program (WFIP), British Columbia.

Readers should note that not all disaster programs are included in the Disaster Income Assistance Programs category.

In Quebec, the majority of AIDA funding is directed into the Provincial Income Stabilization Program. This program is not included in the Disaster Income Assistance Programs category because the AIDA support makes up a small portion of the Provincial Stabilization payments.

Payments under ad hoc programs that compensate for losses due to natural disasters (e.g. ice storm, flood) are recorded in the Other Payments category.

Agricultural Income Disaster Assistance (AIDA) Program (1999 to present)

The Agricultural Income Disaster Assistance (AIDA) program was designed to provide assistance to producers facing dramatic income declines in 1998 and 1999 as a result of factors beyond their control and for which existing programs could not provide assurance of continuing the farm business.

Funded 60% by the federal government and 40% by provincial governments, AIDA is available to anyone in Canada who files income tax returns as a farmer, and whose gross margin has dropped below 70% of their average gross margin over the previous three years. For beginning farmers, a special calculation is used to determine eligibility.

The AIDA program provides individual payments to eligible producers and credits to the provincial governments for programs already established to assist producers. The provincial programs (this list is not exhaustive) that are partly funded by the AIDA program are:

- Agricultural Disaster Insurance Program (ADIP), Prince Edward Island;

- Assurance stabilisation du revenu agricole (ASRA), Québec
- Ontario Whole Farm Relief Program (OWFRP), Ontario
- Farm Income Disaster Program (FIDP), Alberta
- B.C. Whole Farm Insurance Program (BCWFIP), British Columbia.

Agricultural Disaster Insurance Program (ADIP) (1996 to present)

The Agricultural Disaster Insurance Program was designed to provide individual farm operations in Prince Edward Island relief from financial losses caused by disastrous changes in commodity prices, rising input costs, and/or unpredictable production losses.

The program calculates an annual program margin defined in general as the difference between all commodity sales and most operating expenses (except wages, interest, rent, property taxes, and depreciation). If the current year's margin falls below 70% of the average of the previous three years' program margin, the farm may be eligible for a payment. The farm is eligible for a payment if the drop in the program margin is attributed to a decrease in commodity sale prices per unit; and/or an increase in farm input costs per unit; and/or a loss in productivity (i.e., crop destroyed, animal diseases, etc.).

Ontario Whole Farm Relief Program (OWFRP) (1999 to present)

The Ontario Whole Farm Relief Program was introduced in December 1998 to provide financial assistance to farmers suffering from extremely low commodity prices and weather-related disasters. Funding is provided to individual farmers whose gross margins for the reference year fall below 70 per cent of their three to five year average.

Farm Income Disaster Program (FIDP)

This program was established in 1995, and is available to Alberta farmers. It provides a measure of stability against fluctuations in the farm's program margin which is the difference between allowable farm revenue and expenses. It is a whole farm program, which means all agricultural commodities are eligible.

B.C. Whole Farm Insurance Program (1997 to present)

The Whole Farm Insurance Program is a voluntary program instituted in 1997 for British Columbia farmers. The objective is to reduce extreme income reductions that are beyond the farmer's control. Eligible farmers may apply for a claim when their current year program margin falls below 70 per cent of their reference margin.

Net Income Stabilization Account (NISA)

The Net Income Stabilization Account (NISA) was established in 1991 under the Farm Income Protection Act.

The purpose of NISA is to encourage producers to save portion of their income for use during periods of reduced income. Producers can deposit up to 3% of their "Eligible Net Sales" (ENS) annually in their NISA account and receive matching government contributions. The federal government and several provinces offer enhanced matching contributions over and above the base 3% on specified commodities. All these deposits earn a 3% interest bonus in addition to the regular rates offered by the financial institution where the account is held.

Most primary agricultural products are included in the calculation of "Eligible Net Sales" (sales of qualifying commodities minus purchases of qualifying commodities), the main exception being those covered by supply management (dairy, poultry and eggs).

The NISA account is comprised of two funds. Fund No. 1 holds producer deposits while Fund No. 2 contains the matching government contributions and all accumulated interest earned on both Fund 1 and Fund 2. Included as payments in the series «Direct Program Payments to Producers» are the producer withdrawals from Fund 2.

Provincial Stabilization Programs

Under provincial stabilization programs (P.S.P.), payments are made in order to support either producer incomes or prices for selected commodities.

Western Grain Stabilization

The Western Grain Stabilization Act, enacted in 1976, was established to stabilize producers' net proceeds from the production and sale of wheat, oats, barley, rye, flaxseed, canola and mustard seed produced in the Prairie provinces and the Peace River region of British Columbia.

Amendments to the Act in 1988 provided for the addition of nine crops to the seven currently covered. These included: triticale; mixed grains; sunflower; safflower; buckwheat; peas; lentils; fababeans; canary seed. Starting in 1999, payments under this program (mainly recoveries of overpayments) are included in the Other Payments category.

Other Payments

These payments are generally provided under ad hoc municipal, provincial and/or federal government programs established to deal with unusual climatic or economic conditions in the agriculture sector. Also included are payments made under several on-going programs.

The following is a brief description of the programs under "Other Payments".

The programs are listed in alphabetical order.

Acreage Payments

Under the Act to Authorize the Payment of Special Emergency Grants to Farmers, Manitoba producers received a grant for each acre of land comprising his farm in 1971.

Agricultural Disaster Insurance Program (ADIP) (1996 to present)

Prior to 1999, payments under the Agricultural Disaster Insurance Program (ADIP) are classified in the Other Payments category. Starting in 1999, payments under this program are included in the Income Disaster Assistance Program category. For program description, please look under the "Income Disaster Assistance Programs" category.

"Aide aux exploitations ovines affectées par la tremblante" (2000)

This program offers financial assistance to Quebec sheep producers who had to eliminate part of their herd between January 1, 1997 and October 27, 1998. These slaughters were made as part of control measures administered by the Canadian Food Inspection Agency to combat scrapie. This program is funded entirely by the Government of Quebec.

Alberta Farm Income Assistance Program AFIAP (2000 to present)

The Alberta Farm Income Assistance Program (AFIAP) provides Alberta producers (who were farming as of December 31, 1999) with an agricultural assistance package designed to supplement declining farm income due to extreme weather conditions, continuous low commodity prices, and growing input costs. This payment provides qualifying farmers with \$10.29 per acre for all cultivated acres, and \$3.00 per acre on native pasture.

Assistance to Feedlot Operators

Feedlot operators in British Columbia received payments on a per animal fed basis, to encourage the feeding of more cattle for slaughter in the province.

B.C. Whole Farm Insurance Program (1997 to present)

Prior to 1999, payments under B.C. Whole Farm Insurance Program are classified in the Other Payments category. Starting in 1999, payments under this program are included in the B.C. Whole Farm Insurance Program category. For program description, please look under the "Income Disaster Assistance Programs" category.

Beef Cattle Assistance

Under the Beef Cattle Assistance Program for Slaughter Animals, payments were made to Ontario producers for cattle sold for slaughter in 1980. Payments were also made to cow-calf operators based on bred beef cow and heifer inventories at August 1, 1981.

Beef Cow-Calf Assistance

Under the Beef Cow-Calf Assistance Program, payments are provided to Prince Edward Island livestock producers as an incentive for following certain management practices aimed at improving the quality of beef calves.

Beef Cattle and Sheep Support

Under the Beef Cattle and Sheep Support Program, payments were made to Alberta producers in 1982 for bred cows and heifers on inventory as well as feeders, slaughter cattle and lambs sold.

Beef Enhancement

Under the Beef Stabilization Plan, productivity enhancement grants were provided to Manitoba producers. These grants were paid on a per cow basis over the 1982 to 1986 period to encourage cattle production.

Beef Industry Assistance

Under the Beef Industry Assistance Program, Saskatchewan producers received grants on a proportion of their cow herd in order to offset some of the losses on the 1976 calf crop. The grant was also provided to prevent producers from liquidating all or part of the breeding herds in order to reduce their debt load.

Beef Performance Program

The Beef Performance Program was designed to encourage Nova Scotia beef producers to stabilize farm income by participating in Net Income Stabilization Account (NISA) program. It is exclusively a provincial initiative of the Nova Scotia government.

Beef producers who meet the eligibility requirements may choose to receive program payments under Option A – NISA Based Performance Program or Option B – Beef Gross Margin Performance Program.

Included in the Direct Program Payments (DPP) series are the second payment under Option A and the first and second payments under Option B. The first payment

under Option A was not accounted as Direct Program Payments since beef producers have to deposit it in their NISA account.

Beef Quality Incentive (2000 to present)

The Beef Quality Incentive is part of a comprehensive program designed to encourage the marketing of finished beef cattle that meet the specifications of the "Atlantic Tender Beef Classic" branded beef program. The incentive of \$0.03 per pound, based on carcass weight is available to Prince Edward Island producers who are enrolled in the "Atlantic Tender Beef Classic" branded beef program.

Beef Quality Marketing Initiative (2000 to present)

The Beef Quality Marketing Initiative is part of a comprehensive program designed to encourage the marketing of finished beef cattle that meet the specifications of the "Atlantic Tender Beef Classic" branded beef program. The incentive of \$0.03 per pound, based on carcass weight is available to New Brunswick producers who are enrolled in the "Atlantic Tender Beef Classic" branded beef program.

Beehive Production Losses

Under the Beekeepers' Assistance Program, registered beekeepers in Alberta were provided with payments on a per hive basis in recognition of production losses experienced as a result of the 1985 drought and other weather related conditions.

The Big Game Damage Compensation Program

Announced in the fall of 1996, this program enables producers in Saskatchewan to receive certain compensation for commercial crop losses and damage to haystacks caused by big game animals such as white-tailed deer, mule deer, antelope, elk, bear and moose.

Canada-Alberta Farm Income Assistance Program (CAFIAP)

The Canada-Alberta Farm Income Assistance Program is designed to supplement farm income in Alberta for the year 2000.

Canada-British Columbia Assistance Program

The Canada-British Columbia Assistance Program is a general payment program targeting income loss due to damage in 14 commodity groups.

Canada Manitoba Adjustment Program (2000)

The Canada-Manitoba Adjustment Program provides producers of grains, oilseed and special crops with a one-time payment to assist them as they complete the adjustment from the elimination of transportation subsidies during a period of low prices.

Program payments are based on the greater of a

producer's: 1998 qualifying sales or average qualifying sales from 1994 to 1998. Producers who started farming in 1999 had their payment based on their 1999 qualifying sales. Assistance under this program is cost shared by the Government of Canada and the Government of Manitoba.

Canada-Manitoba Adjustment Program 2

The Canada-Manitoba Adjustment Program 2 is designed to aid Manitoba farmers competing in the grains, oilseed and speciality crops sectors. As producers in these sectors are faced with making adjustments to compete in the global market with international competitors that receive significantly higher support.

Canada-Ontario Edible Horticulture Payment

The Canada-Ontario Edible Horticulture Payment provides funding to help offset the income losses experienced in 2000 due to a combination of inclement weather and severely depressed commodity prices.

Canada-Ontario Grain and Oilseed Payment

The Canada-Ontario Grain and Oilseed Payment provides funding to help offset the income losses experienced in 2000 due to a combination of inclement weather and severely depressed commodity prices.

Canada-Ontario Market Revenue Program

The Market Revenue Insurance Program provides farmers with protection from low commodity prices. Payments are made when the average annual Ontario price for the current crop falls below the support price, which is calculated using 85 per cent of the 15-year moving average price. The program is jointly funded by the provincial and federal governments. Payouts received by the producers are reduced by one-third in lieu of a producer premium.

Canada-Saskatchewan 1999 Unseeded Acreage Benefit (1999 to present)

This program compensates producers who did not participate in the 1999 Canada-Saskatchewan Crop Insurance Program for losses incurred due to excessive moisture conditions experienced in the spring of 1999. A compensation payment of \$25 per acre was paid to eligible producers who were unable to seed on or before the 1999 seeding deadline established for crop insurance. Canada and Saskatchewan shared the cost of this program on a 60:40 basis.

Note that an unseeded acreage benefit of up to \$25 per unseeded acre was available to crop insurance customers under the basic crop insurance program. Details of the payment calculation were the same for insured and non-insured producers.

Canada-Saskatchewan Adjustment Program (2000)

The Canada-Saskatchewan Adjustment Program provides producers of grains, oilseed and special crops with a one-time payment to assist them as they complete the adjustment from the elimination of transportation subsidies during a period of low prices.

Program payments are based on the greater of a producer's: 1998 qualifying sales or average qualifying sales from 1994 to 1998. Producers who started farming in 1999 had their payment based on their 1999 qualifying sales. Assistance under this program is cost shared by the Government of Canada and the Government of Saskatchewan.

Canada-Saskatchewan Assistance Program (C-SAP II)

The Canada-Saskatchewan Assistance program II focuses on grains, oilseeds and speciality crops producers to assist them in dealing with income problems. Payments are made to producers based on a percentage of their qualifying sales of grains, oilseeds and speciality crops.

Certified Seed Potato Assistance

The purpose of this Program is to encourage production in Nova Scotia of sufficient high quality seed of licenced potato varieties to supply Provincial requirements.

Compensation for Animal Losses

Under the Animal Disease and Protection Act enacted in 1970, producers in all provinces are compensated when farm animals infected with certain contagious diseases are ordered to be slaughtered. Producers in certain provinces are also compensated for animals killed by wildlife, wild dogs, hunters, etc.

Crop Assistance

Payments were made on a per acre basis to Quebec, Ontario, Manitoba, Saskatchewan, Alberta and British Columbia producers who, because of cold, wet weather in 1973, were unable to seed a substantial portion of their intended crop.

Crop Drought

Under the Crop Disaster Assistance Program, payments were made to help maintain crop production in the drought-stricken southern Prairies and Peace River area. Payments based on yield deficiencies were made to Saskatchewan, Alberta and British Columbia farmers who suffered crop damage due to 1985 drought conditions.

Crop Drought Special Assistance

Under a 1985 program, Saskatchewan producers were

provided with payments such that crops yielding five bushels or less per acre were treated as a total loss.

Conservation Cover Program

The Conservation Cover Program (CCP) is a four-year initiative of the Government of Saskatchewan that will contribute to the cost of converting cropland to perennial cover. The program offers \$15 per acre to a maximum of 50 acres (minimum five acres) per applicant

Crop Insurance Restoration

Under the Crop Insurance Coverage Restoration Program, payments were provided to help restore Alberta producers' crop insurance coverage to the levels they had prior to the dry weather in 1985.

Crop Loss Compensation

Under a special assistance program, payments were made to help Quebec, Manitoba and Saskatchewan farmers overcome the effects of adverse weather in 1983 (floods, winterkill and drought). Producers in certain provinces are also compensated for crops damaged by wildlife.

Crop Restoration Program

This program, co-ordinated with the Manitoba Disaster Financial Assistance Program and is a component of the Jobs and Economic Restoration Initiative, is designed to immediately assist farm operators who have been affected by the 1997 flooding in the Red River Valley. It will enable farmers to resume normal operations and ensure that the maximum acreage of crops is seeded in 1997.

Cull Potato Burial Assistance

Under this program, Prince Edward Island producers are reimbursed 50% of the cost of burying all potatoes.

Dairy Heifer Replacement Bonus

Under the Heifer Bonus Policy, Newfoundland producers were provided with payments to offset rearing costs and encourage the local production and upgrading of dairy cow replacements.

Dairy, Hog and Lamb Production Incentive

Under the Temporary Hog, Dairy and Lamb Production Incentive Program, Alberta producers received payments to encourage production of those commodities. Producers had decreased production because of increased feed prices in 1974.

Disaster Assistance (Peace River)

Through the terms of the Public Safety Services Act,

assistance was provided to producers who suffered severe crop loss because of heavy rainfall.

Disaster Assistance Program South-east Alberta

This program was established in 1991 in Alberta, under the Public Safety Services Act, in response to a prolonged drought across Southern Alberta.

"Eastern Ontario Disaster Relief"

The Eastern Ontario Disaster Relief Committee (EODRC) examines the losses and damages related to agriculture and trees that were submitted in response to the ice storm of 1998. The EODRC is comprised of three main programs: the Ontario Disaster Relief Assistance Program (ODRAP), the Disaster Financial Assistance Arrangements (DFAA) and the Canada-Ontario Agreement (COA). The purpose of these programs is to restore economic activity to the agricultural sector of Eastern Ontario impacted by the January 1998 ice storm, by providing financial assistance for full and part-time farmers.

Included as payments in the series «Direct Program Payments to Producers» is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or reconstruction of capital assets such as buildings, machinery and equipment was excluded, as it is not related to "CURRENT" agricultural production

Farm Income Adjustment Program

The Farm Income Adjustment Program provides producers of non-supply managed agricultural commodities with a one-time payment to assist them in adjusting to lower prices and higher input costs.

Farm Income Assistance

In order to improve farm incomes in 1990, particularly those of grain and oilseed producers in Western Canada, payments were made to producers.

Farm Income Disaster Program (FIDP)

Prior to 1999, payments under Farm Income Disaster Program (FIDP) are classified in the Other Payments category. Starting in 1999, payments under this program are included in the Income Disaster Assistance Program category. For program description, please look under the "Income Disaster Assistance Programs" category.

Farm Support and Adjustment Measures I

This program was announced in the spring of 1991 to help farmers in the grains, oilseeds and horticulture sectors make the transition to the new GRIP and NISA programs.

Farm Support and Adjustment Measures II

In late fall 1991 the Farm Support and Adjustment Measures II program was announced in response to the continuation of the international grain trade war. The program was initiated to provide transitional support to producers until the longer term safety nets programs (GRIP and NISA) were fully implemented. Grain producers were the primary recipients of assistance with lesser amounts available to non-grain sectors including, horticulture, maple syrup, fur, honey and sugar beets.

Feed Freight Assistance Adjustment Fund (FFAAF)

Established as transitional assistance to contribute to the ability of the affected livestock farming operations and industries to adapt to the new economic environment after the Feed Freight Assistance subsidy was terminated.

Feed Grain Adjustment Program (Feed GAP)

This program provided assistance to producers for hogs, lambs, cattle and game animals as long as the animals were finished in the province of Saskatchewan.

Feed Grain Development Program

Under the British Columbia Feed Grain Market Development Program, the province's grain producers received an incentive payment for each eligible ton of grain sold into the British Columbia feed market.

Finished Beef Cattle Assistance

Under the Finished Beef Cattle Assistance Program, payments were made to Nova Scotia finished beef producers. The payments per head of finished beef cattle were provided to assist the production of beef cattle in Nova Scotia and provide more stable economic conditions to the feedlot sector of the industry.

Flood Compensation

Under disaster financial assistance arrangements, payments were made to Alberta producers for crop losses in regions flooded in the summer of 1986.

Forage Transportation

Under a forage transportation assistance program, producers in Saskatchewan and Alberta received assistance, on a per tonne basis, for transporting forage for livestock feed.

Freight Cost Pooling Assistance Program (FCPAP)

Under the Western Grain Transportation Adjustment Fund (WGTAFF) this program will assist producers in Saskatchewan and Manitoba facing higher freight costs because of a change in the Canadian Wheat Board's

(CWB) pooling system.

Fresh Vegetable Incentive

Under the Fresh Vegetable Production Incentive Program, payments were made to Alberta producers on an acreage basis to stimulate commercial fresh vegetable production in 1985.

Grain Embargo

As a result of government actions in response to the Afghanistan situation in 1980, payments were made in compensation for losses resulting from the 1980 partial embargo on grain sales to the Soviet Union. Payments were made to producers in Ontario, Manitoba, Saskatchewan, Alberta and British Columbia.

Greenfeed and Livestock Assistance

Under the 1988 Greenfeed and Livestock Drought Assistance Programs, payments were made to livestock producers in Quebec and the Prairie provinces affected by the 1988 drought. Per head payments were made for breeding livestock in order to help producers maintain their herd, and payments were made on a per acre basis for greenfeed in order to increase feed supplies.

Herd Maintenance Assistance

Under the Herd Maintenance Assistance Program, payments were made to Manitoba, Saskatchewan and Alberta producers to ensure that basic breeding herds were not sold off because of feed shortages as a result of the 1980 drought.

Hog Industry Development Fund

The purpose of this agreement is to provide financial contributions to enhance research and industry development activities with the objective of promoting and enhancing the competitiveness of the hog industry in Alberta.

Hog Production Compensation

A further amount was paid to compensate Newfoundland farmers for the reduction in government assistance following the closure of the processing plant.

Hog Production Subsidy

The production subsidy was designed to offset the difference in price that farmers would receive at the New Brunswick processing plant versus the local Newfoundland which had closed.

Hog Stabilization Fund N.B. (1998 to 1999)

The Hog Stabilization Fund provides provincial and federal financial assistance to producers in New Brunswick

marketing their hogs in this province. This interim program is a stop gap measure between the Triple P Program terminated in August 1997 and the Swine Processing Enhancing Program that started in April 1999.

Hog Transition

Federal and provincial governments agreed to provide transition payments to bridge the gap between the early termination of the National Tripartite Stabilization Plan and the entering of the hog industry into a whole farm income stabilization program (NISA). These benefits to eligible producers, are provided in the form of an Individual Producer Account Program (IPA) or a Hog Industry Development Fund (IDF).

Hog Transportation Assistance

In order to assist with the cost of transporting hogs to slaughter facilities producers in New Brunswick received payments based on the number of hog and the distance to the slaughter plant.

Hog Transportation Subsidy

The transportation subsidy covered the transportation of hogs to meat packers in New Brunswick following the closure of the government supported abattoir in Newfoundland.

Ice Storm Recovery Program

The purpose of the Ice storm Recovery program is to restore economic activity to the agriculture sector of Quebec, impacted by the ice storm of January 1998. It provides financial assistance for part-time farmers. Extraordinary expenses not covered by private insurance companies are eligible for compensation.

Included as payments in the series "Direct Program Payments to Producers" is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or the reconstruction of capital assets such as building, machinery and equipment was excluded, as it is not related to current agricultural production.

The Interim Red Meat Production Equalization Program

Under this program, eligible livestock owners were provided financial assistance. Payments were based on pounds of gain achieved on animals fed for slaughter in Saskatchewan.

Jobs and Economic Restoration Initiative (JERI)

This federal-provincial cost-shared program is designed to help prevent permanent job loss in flood affected areas of Manitoba, and to restore economic activity.

Lambs Payments

Under an emergency financial assistance program, payments were made to Saskatchewan sheep producers because of economic difficulties. Payments were made for each lamb marketed in 1983.

Lean Beef Program: Weaning Weight

The P.E.I. Department of Agriculture designed this program to assist beef producers increase weaning weights of calves and improve beef calf quality. A performance incentive is paid per each calf weighting 450 lbs. And over (adjusted weaning weights).

1996 Lesser Slave Lake Area Disaster Recovery Program

The 1996 Lesser Slave Lake Area Disaster Recovery Program covered losses on uninsurable items suffered in the flood Lesser Lake Area in Alberta. Producers whose main income was from farming were eligible.

Included as payments in the series "Direct Program Payments to Producers" is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or the reconstruction of capital assets such as building, machinery and equipment was excluded, as it is not related to current agricultural production.

Livestock Compensation

Under the South-West Livestock Compensation Program, payments were provided to Saskatchewan producers for livestock lost due to storm conditions in 1982.

Livestock Development Program

Under the Livestock Development Program, livestock producers received payments to assist them in retaining feeder cattle in the provinces of Manitoba (1992 only) and British Columbia.

Livestock Drought

Under the Prairie Livestock Drought Assistance Program, payments were made to help producers in the four Western provinces maintain their breeding herds after the 1984 drought.

Livestock Fodder Procurement

Payments to producers in the Prairie provinces were made under a three part program: Straw Feed Procurement, Straw Ammonisation, and Green-Feed - For Silage Procurement. The program, complementing the Herd Maintenance Assistance Program, was established to offset some adverse effects of drought conditions in 1980.

Livestock Predation Compensation Program (1998 to present)

This program compensates livestock producers in Manitoba for losses from injury or death of eligible livestock that resulted from losses due to natural predators such as black bear, cougar, wolf or coyote. Compensation is available to 100% of the assessed value of the animal, for a confirmed loss due to predation and to 50% of the value for a probable loss. In respect for livestock injured, the payment will be the lesser of the veterinary treatment or the value of the livestock. The government of Manitoba pays 60% of program payments and the Government of Canada 40%. Administration costs are cost-shared 50/50 between the Government of Canada and the Government of Manitoba.

Livestock Special Assistance

Under the Supplemental Livestock Assistance Program, payments were provided to Alberta producers for breeding cows and other qualifying stock. The program was introduced in response to the damaging effects of various weather conditions in 1985.

Livestock Transportation

Under a program instituted in 1984, payments were provided to Saskatchewan livestock producers affected by drought conditions. The assistance was for transportation of livestock from drought condition areas to emergency pastures.

Lower Inventory for Tomorrow

Under the Lower Inventory For Tomorrow (L.I.F.T.) Program, payments were made to producers in the four Western provinces for every 1969 wheat acre taken out of production in 1970.

1999 MFDAP Custom Seeding (1999 to present)

The Custom Seeding payment is a component of the Manitoba Farm Disaster Assistance Program (MFDAP), introduced to help producers affected by the excess moisture conditions during the spring of 1999. Eligible farmers received a maximum of \$10 per seeded acre for costs related to custom land preparation and seeding, retroactive to June 1, 1999.

1999 MFDAP Forage Restoration (1999 to present)

The Forage Restoration payment is a component of the Manitoba Farm Disaster Assistance Program (MFDAP), introduced to help producers affected by the excess moisture conditions during the spring of 1999. Eligible producers received \$75 per acre in financial assistance to help cover the value of lost hay and the cost of restoring tame forage fields damaged by excess moisture.

1999 MFDAP Hay Shortfall (2000)

The Hay Shortfall payment is a component of the Manitoba Farm Disaster Assistance Program (MFDAP), introduced to help producers affected by the excess moisture conditions during the spring of 1999. Eligible producers receive a \$25 per acre payment for hay lands inaccessible because of heavy rain to compensate for feed supply shortages in the winter of 1999-2000. Both tame and native hay acres are eligible, to a maximum of the number of acres normally required to produce the farmers' over winter feed shortfall.

1999 MFDAP Unseeded Acreage (1999 to present)

The Unseeded Acreage payment is a component of the Manitoba Farm Disaster Assistance Program (MFDAP), introduced to help producers affected by the excess moisture conditions during the spring of 1999. Eligible producers received \$50 per acre not seeded on or before June 25 due to excess moisture.

NISA Deposit Assistance Program for Beef

Financial assistance to encourage Nova Scotia beef producers to stabilize farm income by participating in Net Income Stabilization Account (NISA) program. The objective was to assist beef producers in making their matchable NISA deposits.

Participating producers received a payment based on 2% of their eligible net sales of cattle and calves as reported on their 1995 and 1996 NISA application.

This program was exclusively a provincial initiative.

Nova Scotia Farm Income Support Program

The Nova Scotia Farm Income Support Program provided contributions to producers in Nova Scotia for economic hardships experienced in the year 2000.

NTSP Apple Transitional Program

An extent of the NTSP Apple Program, this bilateral agreement between Canada and the provinces of Quebec and Nova Scotia entitles apple growers a further assistance. The program is administered both as a national program as well as a direct payment to producers.

Ontario Farm Income Disaster Program

The Ontario Farm Income Disaster Program (OFIDP) is a whole farm program designed to provide financial support to farmers who experience a significant drop in their income for reasons beyond their control such as declining prices, poor crop yields and increased expenses. The funding is provided to the farmer whose gross margin in the claim year falls below 70% of either their previous 3-year average or their olympic 5-year

average.

Ontario Grain Stabilization Payment

The Ontario Grain Stabilization Payment is a one-time, payment for Ontario grain and oilseed producers. The intent of the initiative is to provide some measure of financial stability to assist Ontario farmers in maintaining competitiveness and offsetting yield reduction, depressed commodity prices and quality reductions for the 2000 crop year.

Permanent Cover Crop Program

The primary objective of the Permanent Cover Program was to reduce soil degradation on marginal lands that had high erosion risk under annual cultivation. It provided assistance to farmers to convert eligible lands from annual crops to perennial forage or tree cover. An initial seeding payment – Permanent cover establishment assistance – was paid to offset some of the cash costs related to plantings forages or trees.

Farmers who chose to sign long-term contracts subsequently received a second payment – Land use contract assistance – intended to offset some of the costs related to changing from growing annual crops to growing permanent cover crops.

Included in the Direct Program Payments (DPP) series is the initial payment only.

The Permanent Cover Program was entirely funded by the Government of Canada and delivered through PFRA (Prairie Farm Rehabilitation Administration), within four provinces – Manitoba, Saskatchewan, Alberta and British Columbia.

Potato Disposal Adjustment Program

The purpose of the program is to provide a one-time decoupled payment to producers to assist in the disposal of surplus potatoes as a result of potato wart and subsequent US border closures.

Potato Diversion

As part of the Potato Diversion Program, Prince Edward Island producers received payments on a per hundredweight basis for a proportion of the 1985-86 potato crop.

Potato Diversion Program

As part of the potato diversion program, Prince Edward Island Producers received payments on a per hundredweight basis for a proportion of the 200-2001 potato crop

Prairie Farm Assistance

Under the Prairie Farm Assistance Act (P.F.A.A.), enacted in 1939, compulsory disaster relief was provided for crops in the four Western provinces on an acreage basis. The program was terminated in 1974.

"Programme spécial relatif au verglas de Janvier 1998"

The purpose of this program is to restore economic activity to the agriculture sector of Quebec impacted by the ice storm of January 1998. It provides financial assistance for full-time farmers. Extraordinary expenses not covered by private insurance companies are eligible for compensation.

Included as payments in the series "Direct Program Payments to Producers" is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or the reconstruction of capital assets such as building, machinery and equipment was excluded, as it is not related to current agricultural production.

This is a federal-provincial cost shared program.

"Programme de reconstruction économique temporaire"

The purpose of this program was to restore economic activity to the regions of Quebec impacted by the heavy rains that occurred on July 19 and 20, 1996, mainly in the regions Saguenay/Lac St.Jean. It provided financial assistance for part-time farmers. Extraordinary expenses not covered by private insurance companies were eligible for compensation.

Included as payments in the series "Direct Program Payments to Producers" is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or the reconstruction of capital assets such as building, machinery and equipment was excluded, as it is not related to CURRENT agricultural production.

This is a federal-provincial cost shared program.

"Programme special relatif aux pluies de Juillet 1996"

The purpose of this program was to restore economic activity to the regions of Quebec impacted by the heavy rains that occurred on July 19 and 20, 1996, mainly in the regions Saguenay/Lac St.Jean. It provided financial assistance for full-time farmers. Extraordinary expenses not covered by private insurance companies were eligible for compensation.

Included as payments in the series "Direct Program

Payments to Producers" is the compensation paid to farmers for the losses related to current agricultural production (for example, costs to replace product or input inventories damaged or lost). The amount paid for the replacement or the reconstruction of capital assets such as building, machinery and equipment was excluded, as it is not related to current agricultural production.

This is a federal-provincial cost shared program

PVYn Compensation Program

A compensation program was announced in spring 1991 to reimburse potato producers in Prince Edward Island, New Brunswick, Ontario, and Alberta for losses incurred as a result of the potato virus Y necrotic (PVYn) eradication program. Some limited additional aid was also included in the program to address subsequent occurrences of the virus.

PVYn Settlement

A settlement for Prince Edward Island potato farmers who were affected by the losses related to errors made in testing the 1991 potato crop for PVYn.

Rain Damage

Payments were made to Quebec and Ontario farmers in areas where crop yields in 1972 were less than 60% of normal due to rain damage.

Red Delicious Apple Assistance

Payments were provided to apple growers across Canada for the Red Delicious variety because of extraordinarily low prices.

Replant Adjustment Program Losses

This program guarantees growers a specific annual revenue per acre during the first three years following the replant of orchards to new varieties.

SIR Clean up and Compliance Grant (2000)

The Clean-up Compliance Grant is a component of the Sterile Insect Release program (SIR) in British Columbia. It is designed to partially offset the additional costs of an intensive spray program or other pest management methods that are required to reduce wild codling moth populations.

Southwestern Alberta Grass Fire Disaster Recovery Program

Funded by the Alberta Government, the Southwestern Alberta Grass Fire Disaster Recovery Program assisted municipalities and individuals affected by the grass fire that swept through parts of southwestern Alberta on December 14, 1997.

Included in the Direct Program Payments (DPP) series is only the one-time compensation payment to farmers for loss of non-insurable winter pasture.

Special Atlantic Livestock Incentive

Payments were made to livestock producers in Atlantic Canada in order to help maintain these industries. Payments were made on hogs, cattle and sheep.

Special Canadian Grains Program

Under the Special Canadian Grains Program, payments were made to producers to help offset low grain and oilseed prices resulting from weak international markets and the United States - European Economic Community trade war.

Special Drought Assistance

Due to losses suffered as a result of the drought in the summer of 1988, producers in every province from Quebec to British Columbia received assistance.

1997 Special Transitional Payment (1997 and 1998)

The 1997 Special Transitional Payment was set up in British Columbia when the Transitional Production Adjustment Program (TPAP) was prematurely terminated as a result of budget cuts. The objective of the Special Transitional Payment was to make a one time payment to growers who would have otherwise qualified for a payment under the Transitional Production Adjustment Program (TPAP) for 1994, 1995 and 1996 plantings. Eligible producers were orchard operators who had satisfactorily completed a replant project, under the Okanagan Valley Tree Fruit Authority Replant Program in 1994, 1995 or 1996.

Special Tree Fruit Assistance

Under this 1991 program tree fruit growers in British Columbia received financial support for maintenance of the longer term viability of the industry. The assistance was targeted to several areas including marketing, research and development and the replanting of orchards to profitable varieties.

Stop Loss for Hogs

Under the 1980-81 Emergency Stop Loss Program for Hogs, payments were made to Alberta producers

whenever market prices for slaughter hogs fell below specified support prices.

Straw for Feed

Due to the 1985 drought conditions, payments were made under the Straw for Feed Program to British Columbia grain producers who sold straw to livestock producers.

Sugar Beet Incentive

Producers in Manitoba and Alberta were provided with an incentive grant to produce sugar beets in 1986.

Sugar Beet Subsidy

Payments on a per tonne basis were made to Manitoba sugar beet producers because of low sugar prices in 1985.

Swine Incentive

Under the Swine Incentive Policy, established in 1985, payments are provided to Prince Edward Island producers on all hogs marketed and on all hogs marketed above individually established base production.

Swine Processing Enhancing Program (1999 to 2000)

The Swine Processing Enhancing Program provides financial assistance to producers in New Brunswick for hogs slaughtered in this province. When the market price drops below the set floor price, the provincial government and the processors each pay half of the difference to hog producers (up to a maximum contribution of \$20 per hog from each). The processors retain the right to "claw-back" from the producers, if hog prices improve, any of their contribution over \$10 per hog.

The Direct Program Payments to Producers series includes half of the payments made to hog producers under this program, the portion corresponding to the government contribution to payments. The Farm Cash Receipts series includes the total payments made under this program.

Temporary Guidelines Modifications

Under the Crop Insurance Modifications to Retain Feed in Drought Areas Program, payments were provided on 1985 crops cut for feed purposes to encourage Alberta farmers to cut as much drought affected crop as possible for feed.

Tobacco Deficiency Payment

A loss encountered by the Tobacco Board when it purchased surplus tobacco was covered by the Agricultural Products Co-op Marketing Agency.

1996 Transitional Production Adjustment Program (TPAP)

Under the Tree Fruit Revitalization Program, this program was designed to guarantee British Columbia orchardists a specific annual revenue per acre during the first three years, following replant of orchards to new high density tree fruit varieties.

Transition Financial Assistance (TFA) Program

Under the Tree Fruit Revitalization program, this program provided further transition assistance to tree fruit growers, while helping to offset the impact of lower prices for their 1993 and 1994 crop. The program also provided transition assistance from the previous support programs to the on-going Net Income Stabilization Account (NISA) Program.

Transportation Adjustment Fund (TAF) (2000)

Transportation Adjustment Fund (TAF) is a one time Provincial payment in British Columbia, intended to give financial assistance to grain and oilseed growers to offset increased transportation costs.

Two Price Wheat Program

In accordance with the provisions of Order-in-Council dated April 18, 1972 and April 17, 1973, payments were made directly to producers for wheat used for human consumption in Canada. Between 1974 and 1978 the payments were made to producers through the Canadian Wheat Board and the Ontario Wheat Producers' Marketing Board under the Two Price Wheat Act enacted in 1973. In provinces where wheat boards were not established, payments were made directly to producers.

Waterfowl Damage

Payments have been made to farmers every year since 1972 to minimize crop losses caused by migratory waterfowl.

Weanling Pig Bonus

Under the Weanling Bonus Incentive Program, established in 1976, payments were made to Newfoundland producers for each weanling pig produced.

Weather-Related Loss Provision Program (2000 to present)

The Weather-Related Loss Provision Program is designed to assist Nova Scotia farmers who are recovering from financial losses to their farm incurred in the 1997 growing seasons as the direct result of adverse weather conditions. The program provides assistance in making payments on the principal of loans taken out to offset these weather-related losses.

Western Diversification ReStart Program

This program is a component of the Jobs and Economic Restoration Initiative. It makes available accountable cash advances to business people and farm operators who have been affected by the 1997 flooding in the Red River Valley. The assistance is available for such things as building repair and livestock replacement.

Western Emergency Assistance

In 1973, payments were made to producers in the Peace River region of Alberta and British Columbia who had suffered a series of bad crop years.

Wintering Beef Cattle

Under the Wintering Beef Cattle Assistance Program, Quebec producers were provided with financial assistance for wintering their cows.

**CANADIAN FARM BALANCE SHEETS AS AT DECEMBER 31 -
CONCEPTS**

The Canadian Farm Balance Sheets have been designed to:

- record the value of farm business assets;
- record the value of farm business liabilities;
- record the value of equity for farm businesses;
- display standard financial ratios which are based on estimates from the balance sheet and the value-added (production) accounts;
- be based on the establishment concept. Industry data in Statistics Canada, as elsewhere in the world, are tabulated by classifying each "establishment" to an industry and by assigning all the activity of each establishment to the designated industry. Thus, the production sector consists of all establishments where the principal economic activity is the production of agricultural products or services.
- display the information as at December 31, by province.

Aggregate balance sheets for the agricultural sector are available for many countries, including the United States, which has produced them since 1944. There has been a significant demand for aggregate Canadian agricultural balance sheets for several years.

Balance sheets are fundamental accounting statements which provide information on the structure of a firm's assets, liabilities and equity, at a specific point in time. Aggregate balance sheet data for the agricultural sector can be used to evaluate the sector's capital and financial position.

Financial ratio analysis is one method of summarizing information contained in standard financial statements and can also provide insight into the performance of the agricultural sector. Four major types of financial ratios which have been calculated include: liquidity, solvency, profitability, and financial efficiency.

A brief discussion concerning the interpretation of financial ratios can be found in Appendix A. The ratios calculated in the tables reflect an aggregate ratio for the agricultural sector. Users should note that both the desired and actual value of the ratios will vary significantly according to the type of farming activity (livestock, crop, horticulture, etc.). Nevertheless, the ratios can serve as useful indicators of the overall financial performance of the agricultural sector.

Four different balance sheet accounts have been developed for Canadian agriculture. This was done to separate the assets and liabilities of farm businesses from those of farm operator households and non-operator landlords. Non-operator landlords are individuals or businesses not engaged in the activity of farming who lease inputs to farm operators. For the purpose of the balance sheet accounts, it is assumed that non-operator landlords lease only farm real estate assets to farm operators.

The four sets of aggregate balance sheets produced for Canadian agriculture are:

- set 1. Balance Sheet of the Agricultural Sector and Farm Operator Households
- set 2. Balance Sheet of the Agricultural Sector
- set 3. Balance Sheet of Farm Businesses and Farm Operator Households
- set 4. Balance Sheet of Farm Businesses of Farm Operators

The **Balance Sheet of the Agricultural Sector and Farm Operator Households** (set 1) includes all farm sector assets and liabilities regardless of ownership. It treats the farm operator households and farm businesses as a single entity. It also includes farm real estate assets leased from non-operator landlords and the liabilities outstanding on these assets.

The **Balance Sheet of the Agricultural Sector** (set 2) was designed to account for only those farm assets and liabilities used in the production of agricultural products. This set includes farm real estate assets leased from non-operator landlords and the liabilities outstanding on these assets. It treats the farm operator households and farm businesses as separate entities, so the personal portion of farm households' assets and liabilities is excluded.

The **Balance Sheet of Farm Businesses and Farm Operator Households** (set 3) reflects the position of farm operators and includes the assets and liabilities of both farm businesses and farm operator households. Thus the value of farm real estate leased or contracted to farm operators by non-operator landlords is not part of this balance sheet. Similarly, the liabilities related to these leased assets are excluded.

The **Balance Sheet of Farm Businesses of Farm Operators** (set 4) was designed to include only the farm business portion of assets and liabilities. This account excludes the assets and liabilities of both non-operator landlords and farm operator households.

For release purposes, data are provided only for the Balance Sheet of the Agricultural Sector (set 2). This is because set 2 most closely reflects the assets employed in the production of agricultural products. The other sets of balance sheet accounts are available on request.

Annual balance sheet estimates are available at both the provincial and Canada level beginning December 31, 1980. The layout of the balance sheet follows that recommended in the "Farm Accounting Standardisation Manual" (1991). Some definitions and comments on the concepts and ratios have also been extracted from this manual. Concepts relating to each component of the balance sheet are discussed in the following pages in the order that they appear in the balance sheet.

ASSETS**CURRENT ASSETS**

Current assets are assets which, in the normal course of operations, are expected to be converted into cash or consumed in the production process within one year. The three components include: cash, bonds and savings; accounts receivable; and inventories.

Accounts receivable are amounts owed to farm businesses, usually arising from the sale of goods or services. Examples include uncollected receipts for grain and livestock sales and custom work.

Inventories are items of tangible property which are held for sale in the ordinary course of business, or are in the process of production for such sale, or are to be directly consumed in the production of goods or services. The three components of inventories are: poultry and market livestock; crops; and inputs.

Poultry and market livestock includes chickens, turkeys, slaughter beef heifers, steers, calves, pigs other than boars or sows, market lambs, and the value of pelting animals on fur farms. Crops include wheat excluding durum, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, tobacco, and potatoes. Inputs include feed, seed, fertilizer, chemicals, fuel, and other supplies used for farm businesses.

HOUSEHOLD CONTENTS

Household contents include assets such as furniture and appliances. The farm business portion of household contents refers to office fixtures and equipment.

QUOTA

Quota is essentially a license, or a right, to sell a certain amount of a specific commodity. This right is regulated by marketing boards. Some quotas (such as milk) are transferable and therefore have a value associated with them. In provinces where quotas are traded, quota values reflect current market values. In provinces where quota trading is prohibited, quotas values are implicitly reflected in the value of fixed assets of agricultural holdings because some of the value of quota is normally capitalized into fixed assets.

BREEDING LIVESTOCK

Breeding livestock consists of animals acquired or raised for the production of progeny or for the production of a livestock product. Breeding livestock includes bulls, dairy cows, beef cows, dairy heifers, beef replacement heifers, boars, sows, rams, ewes, replacement lambs, and breeding stock on fur farms.

MACHINERY

There are three components of machinery: autos, trucks and other machinery. Other machinery includes equipment for tillage, planting, fertilizing, chemical application, harvesting and haying; dairy, poultry, and other livestock equipment; and other miscellaneous items.

FARM REAL ESTATE

Farm real estate includes land, service buildings, and homes. The value of land includes all farm land operated by farm operators. The value of service buildings includes all buildings on the farm which are not homes. The value of homes includes all farm dwellings occupied by farm operators.

TOTAL ASSETS

Total assets includes all "tangible and intangible items

of value" as at December 31. It is the sum of current assets, household contents, quota, breeding livestock, machinery, and farm real estate.

LIABILITIES

CURRENT LIABILITIES

Current liabilities are payable within the current year. Examples include accounts and notes payable within the year.

LONG-TERM LIABILITIES

Long-term liabilities have a maturity beyond one year from the date of the balance sheet. Examples include mortgages and equipment loans owed by farm operators to various lenders. These lenders include: chartered banks; the Farm Credit Corporation; the Farm Business Development Bank; credit unions; treasury branches; Veterans Land Act; federal and provincial agencies; insurance, trust and loan companies; supply companies; private individuals; and advance payment programs.

TOTAL LIABILITIES

Total liabilities include all obligations of a business arising from past transactions that are to be paid in the future. Total liabilities is the sum of current and long-term liabilities.

EQUITY

Equity refers to the ownership interest in the business. Equity equals total assets minus total liabilities and could be considered to be the owners' claim against the assets of the business. Equity is increased by the owners' net contribution of assets to the business and the accumulated net income of the business.

Because equity is derived residually by definition, any change in the value of assets and liabilities will cause a proportionately larger change in the value of equity. However, equity is not as sensitive to a change in its components as is net income which is also derived residually. This is because liabilities are quite small compared to assets, whereas expenses are large when compared to receipts. Regardless, it is still important to keep in mind the residual nature of equity when contemplating any changes in balance sheet values.

FINANCIAL RATIOS

Financial ratios are derived by comparing two or more elements of financial data. The ratios have been categorized according to four financial criteria: 1) liquidity, 2) solvency, 3) profitability and 4) financial efficiency. Each ratio is defined. A brief discussion concerning the interpretation of financial ratios can be found in Appendix A. Readers should note that some combination of the ratios, rather than one single ratio, should be used to assess the performance of the agricultural sector.

LIQUIDITY

Liquidity refers to the ability of a business to meet financial obligations as they come due in the ordinary

course of business. Two liquidity ratios are calculated using balance sheet values: the current ratio and the acid-test (quick) ratio.

The current ratio is defined as current assets divided by current liabilities. This ratio measures a business' ability to meet financial obligations as they come due without disrupting normal operations.

The acid-test (quick) ratio is a variation of the current ratio which is intended to negate some of the drawbacks of the current ratio (see Appendix). The acid-test ratio is defined as the ratio of cash, marketable securities, and accounts receivable to current liabilities. The exclusion of inventories in the calculation allows for an assessment of the 'immediate' liquidity position of farm businesses.

SOLVENCY

Solvency refers to the financial measures that gauge the amount of debt of a business relative to the amount of capital invested in the business. Four solvency ratios are calculated using values from the balance sheet: leverage, equity, debt and debt structure. These ratios are indicators of the risk in investing in the operation: as more debt is added, the greater the risk to all investors, be they creditors or operators.

The leverage ratio is the value of total liabilities per dollar of equity. The ratio is a measure of the degree to which the creditors have financed the business as compared to the owners. The higher the value of the ratio, the greater the financing of the farm business by creditors.

The equity ratio is the value of equity per dollar of total assets. The ratio measures the proportion of total assets financed by the owners, as opposed to that financed by creditors. The higher the value of the ratio the more resources are supplied by the owners as compared with the creditors.

The debt ratio, defined as total liabilities divided by total assets, is a measure of the extent of leverage being used by a business, or the proportion of total assets financed by debt. The higher the value of the ratio, the higher the financial risk.

The debt structure ratio measures the proportion of current liabilities to total liabilities. This ratio, in conjunction with the current ratio, will provide information on the relative solvency of a business.

PROFITABILITY

Profitability refers to the extent to which a business is able to generate profit from the utilization of the business resources. Profitability ratios are calculated using values from the balance sheet accounts and the value-added accounts. This linkage is appropriate because the balance sheet accounts are related to value-added accounts conceptually and methodologically, while this is not necessarily true of the net income accounts (see George W. Beelen's (1983) thesis, "An Alternative System of Financial Accounting for the Canadian Agricultural Production Sector"). The three calculated profitability ratios are: capital turnover, return on assets and return on equity.

The capital turnover ratio is defined as revenue divided by total assets. The ratio indicates the extent to which a business efficiently utilizes its assets to generate revenue. The higher the ratio the more efficiently assets are being used to generate revenue.

Return on assets is defined as net income before taxes plus interest expense less the value of unpaid family and operator labour, divided by the average total assets for the period. The ratio is a measure of return on investment, ie, it reflects earnings per dollar of both owned and borrowed capital. The higher the value of the ratio the greater the return on assets.

Return on equity is defined as net income less the value of unpaid family and operator labour, divided by the average equity for the period. This ratio provides a measure of the return to the owner on the owner's investment in the business, ie, it reflects only the return per dollar of owned capital.

As mentioned earlier there are four different balance sheets available, based on the inclusion or exclusion of non-operator landlords and the personal share of the households. For the return on assets ratio and the return on equity ratio, the returns reflect the different balance sheets. In sets 1 and 2, which include non-operator landlords, the returns include rent to non-operator landlords. In sets 1 and 3, which include the personal share of households, the returns include the family wages.

FINANCIAL EFFICIENCY

Financial efficiency refers to the extent to which a business is able to efficiently utilize the businesses resources. The interest coverage ratio is one example of this type of ratio and is defined as net income before taxes plus interest expense divided by interest expense. This ratio is one of the most widely used ratios for analyzing the ability of a business to pay the interest on debt.

Similar to the return on assets or equity ratios, the interest coverage ratio reflects the inclusion or exclusion of non-operator landlords and the personal share of households.

Note to Users

Users should be especially cautious in using estimates of accounts receivable and cash, bonds and savings data in the provinces of Manitoba, Saskatchewan, Alberta and British Columbia. The estimates of cash, bonds and savings in these provinces may include the value of deferred grain receipts whereas these receipts are generally reported under 'accounts receivable'. However, this should not affect the aggregate estimates of current assets.

CANADIAN FARM BALANCE SHEETS AS AT DECEMBER 31 - METHODS

Several components of the balance sheets are derived from Agriculture Division's farm capital value and farm debt outstanding series. Concepts and methods for these two series should therefore be reviewed for additional information. They are presented in the Statistics Canada publication Agriculture Economic Statistics (Catalogue 21-603E).

For several components of the balance sheets, Farm Credit Corporation (FCC) survey data are used to derive estimates. FCC survey estimates are used for the years 1980, 1983, 1987 and 1989. In intervening years, interpolations are made from the survey estimates. Estimates for 1990 are the same as 1989 survey estimates unless otherwise indicated, pending the availability of 1991 estimates from the 1992 FCC survey.

Estimates of the balance sheet components are calculated for each province and year, so that Canada level estimates are always derived by summing provincial estimates. Annual financial ratios are calculated separately for each province and Canada.

ASSETS

CURRENT ASSETS

Current assets is the sum of cash, bonds, and savings; accounts receivable; and inventories.

Cash, bonds, and savings estimates for sets 1 and 3 are based on FCC survey data. For sets 2 and 4, adjustments are made to exclude the personal share of farm household cash, bonds and savings. It is assumed that two-thirds of the total cash, bonds, and savings relate to the personal share of farm households. This is a rough assumption based on U.S. farm balance sheet data. Thus, two-thirds of the FCC estimate is deducted to exclude the personal share of farm households.

Accounts receivable estimates for set 1 are based on FCC survey data. No adjustments are made for sets 2, 3 and 4.

Inventory estimates are based on several sources. There are three components of inventories: poultry and market livestock; crops; and inputs. All of the value of inventories is assumed to pertain to farm businesses. Estimates for sets 2, 3 and 4 are the same as those for set 1.

The year-end value of **poultry and market livestock** is the sum of year-end values for poultry, market livestock and fur animals for pelting. Year-end values for poultry are derived by multiplying December month-end inventory figures (from the Eggs and Poultry survey) by January value per head data (from administrative sources). Year-end inventory values are derived for beef slaughter heifers, steers, calves, pigs other than boars or sows, and market lambs by multiplying January inventory values (from the January Farm Survey) by January value per head data. January inventory and value per head data are used because December figures are not available. The value of fur animals intended for pelting was not calculated separately for this release, but is included with estimates of the value of breeding livestock.

The value of **crops** is derived by adding year-end values for wheat excluding durum, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, tobacco, and potatoes. These year-end values are derived by multiplying averages of December and January prices by year-end stocks estimates.

Estimates of the value of **inputs** are based on FCC survey data. For 1990, change ratios were applied to the 1989 survey-based estimates. These ratios were developed by

weighting preliminary price change ratios for feed, seed, fertilizer, chemicals and fuel for machinery by provincial expense estimates.

HOUSEHOLD CONTENTS

The value of household contents is derived from the value of homes. Household contents is assumed to be 60% of the value of homes. This assumption is loosely based on the structure of home insurance policy packages where coverage on contents is generally insured at 60% of the dwelling value. For each set, the value of household contents is calculated to be 60% of the corresponding value of homes. As described later, the value of homes itself varies from set to set as adjustments are made to exclude the personal share and the portion leased from non-operator landlords.

QUOTA

Quota estimates for set 1 are based on FCC survey data. No adjustments are made for sets 2, 3 or 4.

BREEDING LIVESTOCK

The year-end value of breeding livestock is the sum of year-end values for bulls, dairy cows, beef cows, dairy heifers, beef replacement heifers, boars, sows, rams, ewes, replacement lambs and breeding stock on fur farms. Year-end inventory values are derived for bulls, dairy cows, beef cows, dairy heifers, beef replacement heifers, boars, sows, rams, ewes and replacement lambs by multiplying January inventory values (from the January Farm Survey) by January value per head data (from administrative sources). January inventory and value per head data are used because December figures are not available. The value of animals on fur farms is derived by multiplying the number of animals on farms at year-end by a value per head which is based on changes in pelt prices. Data for animals on fur farms are obtained from the Livestock Section of Agriculture Division. At this time, the value of animals on fur farms also includes animals for pelting.

MACHINERY

There are three components of machinery: autos, trucks and other machinery.

Auto and truck estimates for sets 1 and 3 are derived from Agriculture Division's capital value series. July 1 values are averaged to estimate year-end values. For the most current year, the July 1 value is used as a proxy for the year-end value. For sets 2 and 4, capital value estimates which exclude the personal share of farm operator households are used. On average, 49% of the value of autos and 77% of the value of trucks is allocated for farm business use.

Other machinery estimates for set 1 are derived from Agriculture Division's capital value of other machinery model. This model estimates the provincial values of other machinery at December 31 in constant 1981 dollars. These values are then converted to current dollars by using provincial Farm Input Price Indexes for Machinery Replacement. No adjustments are made for sets 2, 3 or 4.

FARM REAL ESTATE

There are three components of farm real estate: land, service buildings and homes. Estimates of these values for set 1 are derived from Agriculture Division's capital value of land and buildings series. July 1 values are averaged to estimate year-end values. For the most current year, the July 1 value is used as a proxy for the year-end value.

For set 2, the values of land and service buildings are the same as those in set 1. The farm business portion of homes is derived by multiplying the value of homes in set 1 by 15%. It is assumed that 15% of the farm operator's home is used for farm business purposes. This approach is consistent with that used in related series.

For set 3, the value of farm real estate owned by non-operator landlords is excluded by multiplying estimates of land, service buildings and homes from set 1 by annual provincial ratios. These ratios are based on land tenure data from the FCC surveys.

For set 4, both the personal household share of the value of homes and the value of real estate leased from non-operator landlords needs to be excluded. Estimates of the value of land and service buildings are the same as those for set 3, but the value of homes from set 3 is multiplied by 15% to obtain the business share.

TOTAL ASSETS

Total assets is the sum of current assets, household contents, quota, breeding livestock, machinery and farm real estate.

LIABILITIES**CURRENT LIABILITIES**

Current liabilities is based on Agriculture Division's total debt outstanding series. Estimates of total debt outstanding for each province are multiplied by ratios of current debt to total debt which are derived from FCC survey data. No adjustments are made for sets 2, 3 or 4.

LONG-TERM LIABILITIES

For set 1, long-term liabilities is calculated as total debt outstanding less current liabilities. Long-term liabilities is then adjusted to exclude the portions for non-operator landlords and farm operator households.

For set 2, the value of long-term liabilities excluding the farm household is calculated by multiplying estimates of long-term liabilities from set 1 by the ratio of the total value of farm real estate excluding households from set 2 to the total value of farm real estate including households from set 1.

For set 3, estimates of long-term liabilities for non-operator landlords are deducted from estimates of long-term liabilities from set 1. Estimates of long-term liabilities for non-operator landlords are calculated in the following manner: The sum of Agriculture Division's estimates of mortgage debt held at chartered banks; at the Federal Business Development Bank (FBDB); at credit unions; under the Veterans Land Act; and by insurance, trust and loan companies is multiplied by the proportion

of total agricultural land held by non-operator landlords as determined from FCC land tenure data. Two assumptions are made: 1) only the aforementioned agencies lend to non-operator landlords; and 2) non-operator landlords mortgage the same proportion of the value of their farm real estate as farm operators.

For set 4, the non-operator landlord's share and the personal household share of long-term liabilities are both excluded. Values of long-term liabilities from set 3 (which exclude the non-operator landlord's share) are multiplied by the ratio of the total value of farm real estate excluding the farm household from set 4 to the total value of farm real estate including the farm households from set 3.

TOTAL LIABILITIES

Total liabilities is the sum of current and long term liabilities.

EQUITY

Equity is total assets less total liabilities.

FINANCIAL RATIOS

The balance sheet is used to derive all of the liquidity and solvency ratios. Ratios are calculated for 1980 to 1990 for all four sets of balance sheets.

For the profitability and efficiency ratios, the balance sheet and the value-added (production) account are both used to calculate ratios. Value-added data are available beginning in 1981, so the ratios are calculated only for 1981 to 1990.

LIQUIDITY

The **current ratio** (CA/CL) is defined and calculated as current assets (CA) divided by current liabilities (CL).

The **acid-test (quick) ratio** [(C+AR)/CL] is defined as cash, marketable securities and receivables, divided by current liabilities. To calculate this ratio, the value of cash, bonds, and savings (C) is used as a proxy for cash plus marketable securities. The acid-test ratio is calculated as cash, bonds, and savings (C) plus accounts receivable (AR), divided by current liabilities (CL).

SOLVENCY

The **leverage ratio** (TL/E) is defined and calculated as total liabilities (TL) divided by equity (E).

The **equity ratio** (E/TA) is defined and calculated as equity (E) divided by total assets (TA).

The **debt ratio** (TL/TA) is defined and calculated as total liabilities (TL) divided by total assets (TA).

The **debt structure ratio** (CL/TL) is defined and calculated as current liabilities (CL) divided by total liabilities (TL).

PROFITABILITY

The **capital turnover ratio** (R/TA) is defined as revenue divided by total assets. For our purposes, revenue (R)

is derived from the value-added account by summing: sales of agricultural products, sales of non-agricultural products, and other sources of the value of production. The value used for total assets (TA) is the value of total assets at the **beginning** of the period in which revenues were earned (ie. the value of total assets as at December 31 of the previous year).

Return on assets is defined as net income before taxes (NIBT) plus interest expense (I) less the value of unpaid family and operator labour divided by average total assets (ATA). For set 1, net income before taxes plus interest expense is derived from the value-added series by adding rent to non-operators, corporate profits, wages to family, unincorporated operator returns and interest. For sets 2 and 4, wages to family is not included. Rent to non-operators is not included for sets 3 and 4. Average total assets (ATA) is calculated as the average of total assets at the beginning and end of the year. Thus, return on assets is calculated as $[(NIBT+I)/ATA]$.

Return on equity is defined as net income less the value of unpaid family and operator labour, divided by average equity. Because of the difficulty involved in separating the value of income taxes attributable to farm income from that attributable to non-farm income, income tax expense cannot be estimated for the agricultural sector. Thus, net income cannot be estimated for the agricultural sector, so net income before taxes (NIBT) is used as a proxy for net income. For set 1, net income before taxes is derived from the value-added series by adding corporate profits, wages to family and unincorporated operator returns. For sets 2 and 4, wages to family is not included. Average equity (AE) is calculated as the average of equity at the beginning and end of the year. Thus, return on equity is calculated as $(NIBT/AE)$.

FINANCIAL EFFICIENCY

The **interest coverage ratio** $[(NIBT+I)/I]$ is defined as net income before taxes plus interest expense, divided by interest expense. The method for deriving the numerator $(NIBT + I)$ was described in an earlier paragraph on the return on assets. The denominator (interest expense) is also from the value-added accounts.

APPENDIX A

Ratio analysis is one financial tool that will assist in managing and analyzing a business. However, a proper financial analysis of the business requires more tools than just ratio analysis. Consequently, complete reliance upon such financial measures is a very unsound business practice.

When developing and interpreting financial ratios, many limitations must be kept in mind such as the method of asset valuation; the type, size, and cycle of the business; and the information used to prepare it. Ratios are most meaningful when compared between years. For further information on developing and interpreting financial ratios, refer to the "Farm Accounting Standardization Manual" (1991).

LIQUIDITY

If the current ratio is greater than 1, the business is considered to be liquid. A ratio of less than 1 may

indicate a potential liquidity problem. Users should note that a favourable liquidity position may be a misleading indicator of the ability of current assets to cover current liabilities because a significant portion of the current assets may be comprised of inventories which may not be easily converted to cash. Also, the value of the ratio may vary depending upon the production cycle, ie, the ratio may obtain a significantly different result if calculated in the fall when inventories are typically high than in spring when inventories are usually depleted. The ratio is also limited in that it does not predict the timing nor the adequacy of future cash flows.

An acid-test (quick) ratio of 1 indicates that there are just enough assets of a very liquid nature to cover current liabilities. The desired value of the ratio, however, will vary according to type of farming activity. For example, the desired value of the ratio for a dairy operation will be different than the desired value for a grain operation. The ratio is also limited in that it does not predict the timing nor the adequacy of future cash flows.

SOLVENCY

A leverage ratio of 0.5, for example, indicates that the farm operators have twice as much equity as debt. The higher the value of the leverage ratio, the greater the creditors have financed the farm businesses and thus the higher the risk. The desired value of the ratio will depend upon the income variability of farm businesses and other factors such as the risk associated with production, ie, farm businesses with high income variability or business risk would desire a lower ratio.

The desired value of both the equity ratio and the debt ratio will depend upon the income variability of the business and other factors such as the risks associated with production.

A high debt structure ratio may indicate solvency problems. However, this may not always be the case, especially for farm businesses with a relatively low value of long-term liabilities. In this case, businesses may have no solvency problems. Thus it is important to interpret this ratio in conjunction with the value of liabilities and cash flow from farming operations.

PROFITABILITY

The desired value of the capital turnover ratio will vary significantly by type of farming activity. Users should be aware that the ratio is a comparison of flows over stocks, that is, revenues cover an accounting period while total assets refer to a specific point in time. Therefore the ratio may be misleading in the event that total assets fluctuate significantly in one direction (either up or down) in the accounting period.

Because the value of unpaid family and operator labour is not estimated, the usefulness and the interpretation of return on assets and return on equity may be influenced. Comparisons of these ratios to other return on assets and return on equity ratios should not be made unless the method of calculating the ratios is the same. Also, these ratios do not consider the unrealized capital gains that may be present in the value of assets such as farm land.

The higher the value of return on equity the greater the return on investment. However, a high value for this ratio may signify a highly leveraged business. Therefore, interpretation of the significance of this ratio should be made in conjunction with other ratios.

BALANCE SHEET OF THE AGRICULTURAL SECTOR at December 31, 1981

	Including non-operator landlords and excluding personal share of households ('000 of dollars)

**CONCEPTS
AND
METHODS**

CONCEPTS AND METHODS

Introduction

This publication presents annual estimates of net farm income, farm cash receipts, farm operating expenses and depreciation charges, the index of farm production, current values of farm capital, farm debt outstanding, the farm product price index, direct program payments, the production account, the balance sheet of the agricultural sector, the cash flow account, wage rates for hired agricultural labour and aquaculture. Data highlights are provided for the most current year. Notes on concepts and methods, plus listings of CANSIM databank numbers, are also included for each data series.

Users should note that estimates for the index of farm production have not been made since the 1985 data were released. The balance sheet, production account, and cash flow account series were discontinued in 1994. In 1995 the farm product price index was discontinued and in 1997 wage rates for hired agricultural labour was discontinued. The cash flow was reinstated in 2000.

Supplements to this publication are sent to subscribers twice per year. These supplements provide the most current data as well as revisions to previously published data.

The first supplement is available in June. It includes preliminary estimates for the calendar year just ended for the following series: net farm income, farm cash receipts, farm operating expenses and depreciation charges, farm debt outstanding and direct program payments. It also provides information on current value of farm capital as of July 1 of the previous year. The following December, a second supplement is issued with revisions to the preliminary estimates of net farm income, farm cash receipts, farm operating expenses and depreciation charges, farm debt outstanding, and direct program payments. Revisions to the June issue can extend back two years, while December releases generally apply to three years.

Most data appearing in this publication are available through the Canadian Socio-Economic Information Management System (CANSIM), Statistics Canada's machine-readable database and retrieval system. The Farm Income and Prices Section (FIPS) can also be contacted for further clarification or detail (613)-951-0065, or to obtain data in a different medium.

Statistics Canada is committed to ensuring that there is no disclosure of confidential material and therefore all data are subjected to restrictions prior to release.

In addition to administrative data, there are three main sources (Census of Agriculture, Taxation Data Program, and the Farm Credit Corporation's "Farm Survey"/Farm Financial Survey) whose data contribute to several of the series found in this publication. Following is a brief

overview of these surveys, and a summary of the methods used to reduce errors in each. Copies of any of the survey questionnaires may be obtained by contacting FIPS.

Other surveys, such as the Farm Product Price Survey provide data for a particular series, and consequently are described in the concepts and methods section related to the specific series.

Prior to 1991, the National Farm Survey (NFS) was a major source of data, providing the results of an annual probability survey, with a sample size of 50,000. Detail on concepts, survey methodology and data quality of the NFS are available by contacting FIPS.

The **Census of Agriculture** is a quinquennial survey of all Canadian agricultural holdings, including institutional farms, research stations, community pastures and Indian Reserves.

Procedures for collecting complete and accurate information are developed and improved for each Census of Agriculture. To ensure that the data are of consistently high quality, control procedures are incorporated into each census collection and processing stage.

Some farming operations are missed, however, primarily due to the difficulty in identifying an agricultural holding when no operators live on or near the holding. Certain questionnaires are only partially completed, or not completed at all. Missing responses are obtained through follow up with respondents, or are estimated by employing an automated imputation procedure which assigns values selected from similar agricultural operations. Respondents occasionally provide inaccurate responses. Where such responses have a large impact on the estimate they are corrected or confirmed by contacting the respondents. Computerized checks identify processing errors related to keying entries, or omissions which occurred during manual processes. After processing, the data are validated by comparing them thoroughly with other survey results and administrative data. Technical information on concepts, survey methodology and data quality for the 1996 Census of Agriculture is available in [Agricultural Profile of Canada](#) Statistics Canada Catalogue 93-356-XPB.

The Census of Agriculture is often used as a "benchmark" and a source from which to draw samples. The benchmarking process involves using Census estimates each fifth year, and aligning the interim year's receipt and expense data with the results of the Census of Agriculture. The difference between the previously published estimate and the Census benchmark is calculated and distributed over the four preceding years. This intercensal revision procedure is undertaken for many of the series in this publication, including farm cash receipts, operating expenses, and capital value, whose data then feeds into other accounts published here, such as the net farm income. The 1996 Census of Agriculture results were released on May 14, 1997. Intercensal

revisions incorporating the 1996 Census data are reflected in this publication, June 1999. For further discussion of the impact of 1996 intercensal revisions, please see page 4. The next Census of Agriculture will take place in 2001.

The **Taxation Data Program (TDP)** involves a sample of approximately 160,000 Revenue Canada income tax records. The sampling frame covers all provinces and includes all individuals who claim either positive gross farm income, or non-zero net farm income. Research stations, institutional farms, and Indian Reserves are excluded. The sampling frame includes all corporations which report minimum sales of \$25,000, for which 51% or more of their sales come from agricultural activities.

Records for approximately 95% of the sample are received and raising factors are adjusted where the sample is incomplete. Basic edit checks are performed at the data capture stage and subsequent editing identifies errors, inconsistencies, extreme values, etc. As a final check, the top 25 tax filers (records which contribute the most for each income and expense item), at the provincial level, are analysed further. A process of donor imputation, using similar tax filer records, is applied in cases where tax filers fail to itemize all (or part) of their revenues or expenses. Total revenue and expense items for farms are estimated by inflating each sampled item by an estimation weight.

The processing procedures described above help minimize the occurrence of non-sampling errors (such as errors introduced during editing, and response errors) but some errors are outside Statistics Canada's control, including the fact that Revenue Canada tax forms are designed for tax purposes and not survey purposes. Since TDP estimates are based on a sample rather than the total population, they are subject to sampling errors. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the standard error. Over repeated surveys, 95 times out of 100, the relative difference between a sample estimate and what would have been obtained from an enumeration of all operations would be less than twice the coefficient of variation. This range of values is referred to as the confidence interval. While published estimates may not exactly equal the level indicators (due to the validation and consultation process), these estimates do remain within the confidence interval of the survey level indicators. The 1997 TDP survey had a coefficient of variation range of 0.5% to 1.7% for total operating revenues and expenses. Tables of standard error or coefficients of variation are available by contacting WFDP at (613) 951-8722.

The quality of the TDP estimates is affected by certain limitations: the information is not collected from a standard questionnaire, but from different types of statements of income and expenses; secondly, under the Income Tax Act, tax filers can report either on a cash or an accrual basis.

The imputation of missing values may affect the accuracy of tabulations. Further documentation concerning concepts, data reliability, limitations or the methodology of this survey is available by consulting Economic Overview of Farm Incomes, Statistics Canada catalogue no. 21-005-XIE.

The **Farm Credit Corporation** has conducted surveys (reference years 1981, 1984, 1987, 1989, and 1991) dealing with the financial structure of Canadian agriculture. This was a joint project of the Farm Credit Corporation (management, collection and processing personnel), Agriculture and Agri-Food Canada (financial support, collection and processing personnel), and Statistics Canada (survey and questionnaire design, processing and analysis of data). The structure of the Farm Survey evolved over time, with the 1991 survey having a Census-based sample of 12,000 farms with sales of over \$2000. These excluded institutional farms, farms on Indian Reserves, community pastures, farms in marginal areas and farms that were part of large multi-holding companies. A smaller area frame, based on the National Farm Survey area frame, was also used, in order to include entrants into agriculture since the previous Census. To ensure that the survey estimates were as reliable as possible, survey questionnaires were scanned for any comments, and the top 25 contributors were checked after capture to ensure correctness of entries. Where an incomplete questionnaire was returned, data were imputed from a record with similar key characteristics (such as size, type of production and location). If key information was missing the record was rejected and the weighting factor for the stratum adjusted. During data validation, the estimates derived from the survey were compared to estimates compiled by Statistics Canada, and coefficients of variation were also examined.

In 1992, the FCC Farm Survey was replaced by the Farm Financial Survey (FFS), conducted under contract with Agriculture and Agri-Food Canada. In 1993, the survey was conducted in Western Canada only, with financial data referring to 1992. A full survey was conducted across Canada in 1994 (1993 reference year), 1996 (1995 reference year) and 1998 (1997 reference year). It is expected to be conducted biennially in the future.

As the FCC Survey and the FFS estimates were based on a sample rather than on the entire population, they were subject to sampling errors. The potential error introduced by sampling can be estimated from the sample itself by using a statistical measure called the standard error. The latest FFS had a coefficient of variation of 0.91% for total assets, and 1.57% for total liabilities. The usable responses (excludes total refusals, no contacts, and others) returned from this survey totalled 90% of the sample. Tables of standard error or coefficients of variation are available by contacting Whole Farm Data. Further documentation concerning concepts, data quality and reliability, limitations or the methodology of this survey is available by calling (613) 951-2435.

For administrative data, in order to reduce error, assessments are made based on historical and current trends, subject matter expertise, and information obtained through discussion with industry authorities. Users should be aware that administrative data are generally compiled for an organization's own needs, and not for survey purposes. Any anomalies or inconsistencies detected are verified with the source, and where necessary, adjustments are made to reconcile data with the conceptual framework of our series. The administrative agencies used are considered to be the best sources available, and data received from them is judged to be of very good quality, even in those circumstances where adjustments have been made.

In some instances component data may not add to the total. This is ordinarily due to rounding, and considered to be of minimal impact.

IMPACT OF INTERCENSAL REVISIONS

In May 1999, intercensal revisions were released for the period 1986 to 1997. All series were revised in accordance with the results of the 1996 Census of Agriculture. At the same time, conceptual and methodological changes, improved coverage and changes in sources were also implemented. This section describes the impact of intercensal revisions on farm cash receipts, operating expenses, net cash income, income in kind, depreciation, value of inventory change and farm capital value. The following section shows the major contributors to the revisions. More information is available by contacting the Farm Income and Prices Section at (613) 951-2441 or (613) 951-6357.

Reasons for and Impact of Revisions

All comparisons are made for the calendar year 1995, which allowed the comparison of published data with the results of the 1996 Census of Agriculture and a complete Taxation Data Program sample. Differences were calculated by comparing the estimates published in May 1999 (after revision) with those published in November 1998 (before revision).

Canada

Farm Cash Receipts: +\$148.3 million (+0.6%)

Forest Product Receipts

Impact of benchmarking to the 1996 Census of Agriculture:

Impact on:

- Forest Product Receipts: +\$51.3 million
- Total Farm Cash Receipts: +0.2%

Hay and Clover Receipts

Impact of concept, method and/or source changes:

Hay sales to the recreational sector (off-farm horses) have now been included back to 1991 using the Taxation Data Program. Data on sales to feedmills have been revised back to 1991 using the Taxation Data Program due to limitations in the previous data source.

Impact on:

- Hay and Clover Receipts: +\$46.0 million
- Total Farm Cash Receipts: +0.2%

Cattle and Calf Receipts

Impact of benchmarking to the Livestock Section supply and disposition balance sheets:

Impact on:

- Cattle Receipts: -\$68.9 million
- Calf Receipts: +\$43.0 million
- Total Farm Cash Receipts: -0.1%

Horse Receipts

Impact of concept, method and/or source changes:

Slaughter data from the Canadian Food Inspection Agency were included back to 1986. International exports of slaughter horses were included using data from the International Trade Division, Statistics Canada back to 1988.

Impact on:

- Horse Receipts: confidential
- Total Farm Cash Receipts: confidential

Other Receipts and Payments

Impact of benchmarking to the 1996 Census of Agriculture and concept, method and/or source changes:

- a) the benchmarking to the 1996 Census of Agriculture done by Livestock and Crops Sections;
- b) disaggregating commodities previously included in "miscellaneous crops" (canary seed in Alberta, dry peas in British Columbia, dry beans in Quebec and Manitoba, canola in Quebec);
- c) better accounting and processing of new information.

Impact on:

- Fruit and Vegetable Receipts: +\$15.6 million
- Grain, Oilseed and Pulse Receipts: +\$9.8 million
- Floriculture, Nursery and Sod Receipts: +\$9.2 million
- Hog Receipts: -\$4.3 million
- Sheep and Lamb Receipts: +\$2.9 million
- Dairy, Poultry and Egg Receipts: -\$6.0 million
- Crop receipts identified in part "b" above: +\$22.2 million
- Total Farm Cash Receipts: +0.1%

Farm Expenses: +\$127.5 million (+0.6%)

Electricity, Telephone and Heating Fuel

Impact of benchmarking to the 1996 Census of Agriculture:

The analysis of the previously published utilities expenses in comparison with the census and industry sources suggest that previous trends of the tax estimates have been affected by changes in the reporting format and the introduction of electronic tax filing. Industry sources confirmed the upward adjustments from the published data to the census data.

Impact on:

- Electricity, Telephone & Heating Fuel: +\$168.1 million
- Total Operating Expenses: +0.8%

Machinery Fuel

Impact of benchmarking to the 1996 Census of Agriculture:

The Taxation Data Program was used as the source for estimating machinery fuel. An analysis of the 1995 tax data in comparison with the results of the Census of Agriculture led to a downward revision of this item. Tax data were inflated due to the inclusion of fuel for trucking services and custom work. The adjustment also reflects the fact that farm machinery has become more fuel-efficient.

Impact on:

- Machinery Fuel: -\$106.7 million
- Total Operating Expenses: -0.5%

Fertilizer and Lime

Impact of concept, method and/or source changes:

The estimates were revised downward to reflect sales data from industry sources. Purchases for resale are suspected to have been included in both the Census of Agriculture data and the Taxation Data Program.

Impact on:

- Fertilizer and Lime: -\$82.3 million
- Total Operating Expenses: -0.4%

Twine, Wire and Containers

Impact of benchmarking to the 1996 Census of Agriculture:

Increased use of plastic wrap for hay and other field crops, the trend toward more direct retailing by agricultural producers and the rapidly expanding greenhouse industry resulted in a doubling of twine, wire, and container expenses since 1985. This rapid increase was not reflected in the Taxation Data Program estimates or the Farm Input Price Index, the main contributors to calculating the expense estimate for this item.

Impact on:

- Twine, Wire and Containers: +\$72.4 million
- Total Operating Expenses: +0.3%

Legal and Accounting Fees

Impact of concept, method and source changes:

The Taxation Data Program is used as the source for estimating the category "other expenses". Legal and accounting fees were removed from "other expenses" back to 1991 and published as a separate item.

Impact on:

- Other Expenses: -\$510.5 million
- Legal and Accounting Fees: +\$497.3 million
- Net Impact on Other Expenses: -\$13.2 million (-1.4%)
- Total Operating Expenses: -0.1%

Net Cash Income: +\$20.8 million (+0.4%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +0.6% and farm cash receipts by +0.6%. In 1995, the net cash income estimate was revised upward by \$20.8 million.

Income in Kind: -\$69.4 million (-31.5%)

Forest Products

The method used to estimate on-farm forest product consumption was revised back to 1986. Updated data reflecting fewer farm households and increased efficiency in wood heating appliances were incorporated.

Impact on:

- Forest Product Income in Kind: -\$42.1 million
- Total Income in Kind: -19.1%

Beef, Veal, Mutton, Lamb and Pork

The method used to estimate Income in Kind for meat was adjusted to integrate this series with the "killed and eaten" figures available from the Livestock Section balance sheets back to 1986.

Impact on:

- Meat Income in Kind: -\$25.4 million
- Total Income in Kind: -11.5%

Depreciation: -\$181.3 million (-5.2%)

An adjustment was made back to 1991 to eliminate double counting. The practice of leasing farm machinery and vehicles (i.e., tractors, combines, cars and trucks) has increased through the 1990s. Farmers reported leasing costs as operating expenses on their tax forms. The capital value series, to which depreciation rates were applied, included both owned and leased machinery and equipment. During intercensal revisions, the value of leased vehicles and machinery was excluded from the calculation for depreciation beginning in 1991. The capital value series, however, continues to include both the value of owned and leased vehicles and machinery.

Value of Inventory Change: +\$241.3 million (+50.8%)

Cattle and Calf Value of Inventory Change (VIC)

Revisions were made back to 1991. Revised livestock inventory numbers from the Livestock Section were incorporated in the VIC series. The revised inventories reflect benchmarking to the 1996 Census of Agriculture.

Impact on:

- Cattle and Calf VIC: +\$212.2 million
- Total VIC: +44.7%

Corn Value of Inventory Change (VIC)

The method of calculating farmer-owned corn inventories in Ontario was revised back to 1986.

Impact on:

- Corn VIC: +\$38.6 million
- Total VIC: +8.1%

Farm Capital Value:

Estimates of the value of land and buildings are benchmarked quinquennially to the Census of Agriculture. In 1996, the Census level was used for all provinces. Machinery and equipment and livestock and poultry inventories were benchmarked to the census in all provinces.

The following table shows the size of the revisions for each of the three categories, by province, comparing intercensally revised estimates released in May 1999 with the values published in November 1998, both on the 1980 Standard Industrial Classification basis.

Impact of Revision on 1996 Farm Capital Value

	Land and buildings	Machinery And equipment	Livestock and poultry	Total capital value
	%	%	%	%
Canada	4.7	-2.5	0.6	3.0
Nfld.	-1.6	-22.2	-2.2	-5.8
P.E.I.	17.6	4.6	-0.8	13.8
N.S.	8.6	-15.5	-0.3	2.1
N.B.	10.9	-12.2	-5.8	3.1
Que.	5.3	-5.3	-1.0	2.3
Ont.	6.4	-1.5	2.7	5.1
Man.	0.7	-7.2	-4.4	-1.8
Sask.	-2.0	-2.8	0.8	-2.0
Alta.	6.4	-1.6	1.7	4.4
B.C.	9.3	14.5	2.0	9.4

Provincial Impacts

Newfoundland

Farm Cash Receipts: -\$1.2 million (-1.7%)

Dairy Receipts

The revisions are the result of improved data for inter-provincial sales of milk.

Impact on:

- Dairy Receipts: -\$1.0 million
- Total Farm Cash Receipts: -1.5%

Cattle Receipts

The revisions are the result of revising the method where average slaughter weight is now estimated using a fixed value based on historical data.

Impact on:

- Cattle Receipts: +\$0.4 million
- Total Farm Cash Receipts: +0.5%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crop receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$0.4 million
- Total Farm Cash Receipts: -0.5%

Hog Receipts

The revisions are the result of benchmarking to the Livestock Section balance sheets.

Impact on:

- Hog Receipts: -\$0.3 million
- Total Farm Cash Receipts: -0.4%

Farm Expenses: +\$3.9 million (+7.1%)

Commercial Feed:

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: +\$1.7 million
- Total Operating Expenses: +3.0%

Net Cash Income: -\$5.1 million (-46.4%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +7.1% and farm cash receipts by -1.7%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised downward by \$5.1million.

Prince Edward Island

Farm Cash Receipts: -\$0.4 million (-0.1%)

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$1.0 million
- Total Farm Cash Receipts: -0.3%

Cattle Receipts

The revisions are the result of reallocating part of the home consumption estimate (or income in kind) to domestic slaughter to be consistent with the Livestock Section balance sheets back to 1986.

Impact on:

- Cattle Receipts: +\$0.3 million
- Total Farm Cash Receipts: +0.1%

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Product Receipts: +\$0.2 million
- Total Farm Cash Receipts: +0.1%

Farm Expenses: +\$9.5 million (+4.1%)

Commercial Seed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture the potato, vegetable and greenhouse industries expanded more rapidly than was reflected in the commercial seed expense.

Impact on:

- Commercial Seed: +\$4.1 million
- Total Operating Expenses: +1.8%

Fertilizer and Lime

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture the potato, vegetable and greenhouse industries expanded more rapidly than was reflected in the fertilizer and lime expense.

Impact on:

- Fertilizer and Lime: +\$3.3 million
- Total Operating Expenses: +1.4%

Net Cash Income: -\$9.9 million (-12.1%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +4.1% and farm cash receipts by -0.1%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised downward by \$9.9 million.

Nova Scotia

Farm Cash Receipts: +\$9.0 million (+2.7%)

Floriculture, Nursery and Sod Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Floriculture, Nursery and Sod Receipts: +\$7.7 million
- Total Farm Cash Receipts: +2.3%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$2.4 million
- Total Farm Cash Receipts: -0.7%

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Product Receipts: +\$2.1 million
- Total Farm Cash Receipts: +0.6%

Potato Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Potatoes Receipts: -\$1.2 million
- Total Farm Cash Receipts: -0.4%

Vegetable Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Vegetables Receipts: +\$1.2 million
- Total Farm Cash Receipts: +0.4%

Farm Expenses: +\$1.4 million (+0.5%)

Commercial Feed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, Taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: -\$2.0 million
- Total Operating Expenses: -0.7%

Twine, Wire and Containers

Impact of benchmarking to the 1996 Census of Agriculture:

Increased use of plastic wrap for hay and other field crops, the trend toward more direct retailing by agricultural producers and the rapidly expanding greenhouse industry resulted in a doubling of twine, wire, and container expenses since 1985. This rapid increase was not reflected in the Taxation Data Program estimates or the Farm Input Price Index, the main contributors to calculating the expense estimate for this item.

Impact on:

- Twine, Wire and Containers: +\$1.6 million
- Total Operating Expenses: +0.6%

Cash Wages

Impact of change in source data and benchmarking to the 1996 Census of Agriculture:

The Greenhouse, Sod and Nursery Industries Survey was used to identify the inclusion of the non-agricultural, retail cash wage component in the 1996 Census of Agriculture. The Greenhouse, Sod and Nursery Industries Survey ratio of wages to area under glass was applied to the census estimate of area under glass to obtain the non-agricultural wages in the greenhouse sector. This was then subtracted from the census estimate.

Impact on:

- Cash Wages: -\$1.4 million
- Total Operating Expenses: -0.5%

Net Cash Income: +7.6 million (+15.2%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +0.5% and farm cash receipts by +2.7%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised upward by \$7.6 million.

New Brunswick

Farm Cash Receipts: -\$6.6 million (-2.2%)

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$2.9 million
- Total Farm Cash Receipts: -1.0%

Vegetable Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Vegetable Receipts: -\$1.8 million
- Total Farm Cash Receipts: -0.6%

Cattle Receipts

The revisions are the result of revising the method where average slaughter weight is now estimated using a fixed value based on historical data.

Impact on:

- Cattle Receipts: -\$1.3 million
- Total Farm Cash Receipts: -0.4%

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Product Receipts: -\$0.9 million
- Total Farm Cash Receipts: -0.3%

Farm Expenses: -\$0.8 million (-0.3%)

Commercial Feed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: -\$3.7 million
- Total Operating Expenses: -1.5%

Cash Wages

Impact of benchmarking to the 1996 Census of Agriculture:

The Greenhouse, Sod and Nursery Industries Survey was used to identify the inclusion of the non-agricultural, retail cash wage component in the 1996 Census of Agriculture. The Greenhouse, Sod and Nursery Industries Survey ratio of wages to area under glass was applied to the census estimate of area under glass to obtain the non-agricultural wages in the greenhouse sector. This was then subtracted from the census estimate.

Impact on:

- Cash Wages: -\$2.7 million
- Total Operating Expenses: -1.1%

Net Cash Income: -\$5.8 million (-12.3%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by -0.3% and farm cash receipts by -2.2%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised downward by \$5.8 million.

Quebec**Farm Cash Receipts: -\$14.8 million (-0.3%)**Calf Receipts

The revisions are due to:

- a) the benchmarking of Livestock Section balance sheets to the 1996 Census of Agriculture;
- b) the reduction of interprovincial exports of calves from Quebec to reflect the specific production type in Quebec (mix of milk/grain feed calves and feeder calves) and to better reflect the current trend of interprovincial imports to Ontario.

Impact on:

- Calf Receipts: -\$32.4 million
- Total Farm Cash Receipts: -0.7%

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Product Receipts: +\$13.5 million
- Total Farm Cash Receipts: +0.3%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$9.6 million
- Total Farm Cash Receipts: -0.2%

Gross Revenue Insurance Plan (GRIP) Payments

The revisions are the result of a better accounting and processing of new information.

Impact on:

- GRIP Payments: -\$6.6 million
- Total Farm Cash Receipts: -0.2%

Farm Expenses: +\$69.8 million (+2.1%)Commercial Feed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total

feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: -\$22.6 million
- Total Operating Expenses: -0.7%

Cash Wages

Impact of change in source data and benchmarking to the 1996 Census of Agriculture:

The Greenhouse, Sod and Nursery Industries Survey was used to identify the inclusion of the non-agricultural, retail cash wage component in the 1996 Census of Agriculture. The Greenhouse, Sod and Nursery Industries Survey ratio of wages to area under glass was applied to the census estimate of area under glass to obtain the non-agricultural wages in the greenhouse sector. This was then subtracted from the census estimate.

Impact on:

- Cash Wages: +\$19.3 million
- Total Operating Expenses: +0.6%

Commercial Seed

Impact of concept, method and/or source changes:

The Greenhouse, Sod and Nursery Industries Survey was used to determine the quantity of seed normally bought for resale in this sector. A ratio of resale seed to total seed expenditure, calculated using the Greenhouse, Sod and Nursery Industries Survey, was then applied to the census estimate. This eliminated interfarm purchases and the resale portion of seed expense from the census estimate.

Impact on:

- Commercial Seed: -\$18.4 million
- Total Operating Expenses: -0.5%

Net Cash Income: -\$84.6 million (-8.0%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +2.1% and farm cash receipts by -0.3%. However because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised downward by \$84.6 million.

Ontario**Farm Cash Receipts: +\$35.5 million (+0.6%)**Hay and Clover Receipts

Hay sales to the recreational sector (off-farm horses) have now been included back to 1991 using the Taxation Data Program. Data on sales to feedmills have been revised back to 1991 using the Taxation Data Program due to limitations in the previous data source.

Impact on:

- Hay and Clover Receipts: +\$16.1 million
- Total Farm Cash Receipts: +0.3%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$13.8 million
- Total Farm Cash Receipts: -0.2%

Wheat (excluding durum)

An update was required to wheat (excluding durum) prices in 1995.

Impact on:

- Wheat (excluding durum) Receipts: +\$11.1 million
- Total Farm Cash Receipts: +0.2%

Cattle Receipts

The revisions are the result of revising the method where average slaughter weight is now estimated using a fixed value based on historical data.

Impact on:

- Cattle Receipts: +\$4.2 million
- Total Farm Cash Receipts: +0.1%

Farm Expenses: +\$30.7 million (+0.6%)Fertilizer and Lime

Impact of concept, method and/or source changes:

Previously published estimates were revised downward because of information received from the Fertilizer Institute of Ontario, which found that the quantity of fertilizer used between 1990 and 1995 had declined. This was attributed to new technology which permitted for more focussed application of fertilizer. Shipment and import data supported the findings of the Fertilizer Institute of Ontario.

Census data were not accepted because they did not reflect the findings of the Fertilizer Institute of Ontario data. Also, after comparing the census data to those of the Greenhouse, Sod and Nursery Industries Survey, it was found that the Census data contained interfarm sales, retail sales and double counting in large enterprises.

Impact on:

- Fertilizer and Lime: -\$61.0 million
- Total Operating Expenses: -1.2%

Commercial Seed

Impact of concept, method and/or source changes:

The Greenhouse, Sod and Nursery Industries Survey was used to determine the quantity of seed normally bought for resale in this sector. A ratio of resale seed to total seed expenditure, calculated using the Greenhouse, Sod and Nursery Industries Survey, was then applied to the census estimate. This eliminated interfarm purchases and the resale portion of seed expense from the census estimate.

Impact on:

- Commercial Seed: -\$35.7 million
- Total Operating Expenses: -0.7%

Twine, Wire and Containers

Impact of benchmarking to the 1996 Census of Agriculture:

Increased use of plastic wrap for hay and other field crops, the trend toward more direct retailing by agricultural producers and the rapidly expanding greenhouse industry resulted in a doubling of twine, wire, and container expenses since 1985. This rapid increase was not reflected in the Taxation Data Program estimates or the Farm Input Price Index, the main contributors to calculating the expense estimate for this item.

Impact on:

- Twine, Wire and Containers: +\$28.3 million
- Total Operating Expenses: +0.5%

Net Cash Income: +\$4.9 million (+0.4%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +0.6% and farm cash receipts by +0.6%. In 1995, the net cash income estimate was revised upward by \$4.9 million.

Manitoba**Farm Cash Receipts: +\$14.7 million (+0.6%)**Dry Bean Receipts

A data series was added for dry beans back to 1992.

Impact on:

- Dry Bean Receipts: +\$15.5 million
- Total Farm Cash Receipts: +0.6%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crops receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$10.2 million
- Total Farm Cash Receipts: -0.4%

Lamb Receipts

The revisions are due to benchmarking to the Livestock Section balance sheets.

Lamb receipts rose due to an increase in the interprovincial exports of lambs.

Impact on:

- Lamb Receipts: +\$4.4 million
- Total Farm Cash Receipts: +0.2%

Hog Receipts

The revisions are the result of benchmarking to the Livestock Section balance sheets.

Impact on:

- Hog Receipts: -\$4.1 million
- Total Farm Cash Receipts: -0.2%

Farm Expenses: +\$13.1 million (+0.6%)Commercial Feed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: +\$12.0 million
- Total Operating Expenses: +0.5%

Machinery Fuel

Impact of benchmarking to the 1996 Census of Agriculture:

The Taxation Data Program was used as the source for estimating machinery fuel. An analysis of the 1995 tax data in comparison with the results of the Census of Agriculture led to a downward revision of this item in Manitoba. Tax data were inflated due to the inclusion of fuel for trucking services and custom work. The adjustment also reflects the fact that farm machinery has become more fuel-efficient.

Impact on:

- Machinery Fuel: -\$8.7 million
- Total Operating Expenses: -0.4%

Net Cash Income: +\$1.6 million (+0.4%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +0.6% and farm cash receipts by +0.6%. In 1995, the net cash income estimate was revised upward by \$1.6 million.

Saskatchewan**Farm Cash Receipts: +\$23.3 million (+0.4%)**Cattle and Calf Receipts

The revisions are due to:

- a) the benchmarking of the Livestock Section balance sheets to the 1996 Census of Agriculture;
- b) the reallocation of a segment of Saskatchewan interprovincial exports of cattle to the calf category.

Impact on:

- Cattle Receipts: -\$85.5 million
- Calf Receipts: +\$75.5 million
- Total Farm Cash Receipts: -0.2%

Hay and Clover Receipts

Hay sales to the recreational sector (off-farm horses) have now been included back to 1991 using the Taxation Data Program. Data on sales to feedmills have been revised back to 1991 using the Taxation Data Program due to limitations in the previous data source.

Impact on:

- Hay and Clover Receipts: +\$8.1 million
- Total Farm Cash Receipts: +0.2%

Miscellaneous Crop and Livestock Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crop and livestock receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: -\$3.9 million
- Miscellaneous Livestock Receipts: +\$11.1 million
- Total Farm Cash Receipts: +0.1%

Hog Receipts

The revisions are due to benchmarking to the Livestock Section balance sheets.

Saskatchewan was the only province in 1995 that saw an increase in hog receipts due to an increase in the number of hogs slaughtered.

Impact on:

- Hog Receipts: +\$3.9 million
- Total Farm Cash Receipts: +0.1%

Farm Expenses: -\$18.8 million (-0.5%)

Machinery Fuel

Impact of benchmarking to the 1996 Census of Agriculture:

The Taxation Data Program was used as the source for estimating machinery fuel. An analysis of the 1995 tax data in comparison with the results of the Census of Agriculture led to a downward revision of this item in Saskatchewan. Tax data were inflated due to the inclusion of fuel for trucking services and custom work. The adjustment also reflects the fact that farm machinery has become more fuel-efficient.

Impact on:

- Machinery Fuel: -\$49.9 million
- Total Operating Expenses: -1.3%

Commercial Feed

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, Taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: +\$23.9 million
- Total Operating Expenses: +0.6%

Net Cash Income: +\$42.1 million (+2.8%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by -0.5% and farm cash receipts by +0.4%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised upward by \$42.1 million.

Alberta

Farm Cash Receipts: +\$54.7 million (+0.9%)

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Products Receipts: +\$23.0 million
- Total Farm Cash Receipts: +0.4%

Miscellaneous Livestock Receipts

The revisions are due to updating the percentage used to estimate miscellaneous livestock receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Livestock Receipts: +\$10.1 million
- Total Farm Cash Receipts: +0.2%

Hay and Clover Receipts

Hay sales to the recreational sector (off-farm horses) have now been included back to 1991 using the Taxation Data Program. Data on sales to feedmills have been revised back to 1991 using the Taxation Data Program due to limitation in the previous data source.

Impact on:

- Hay and Clover Receipts: +\$7.9 million
- Total Farm Cash Receipts: +0.1%

Cattle Receipts

The revisions are the result of revising the method where average slaughter weight is now estimated using a fixed value based on historical data.

Impact on:

- Cattle Receipts: +\$6.4 million
- Total Farm Cash Receipts: +0.1%

Farm Expenses: -\$22.2 million (-0.5%)Commercial Feed:

Impact of benchmarking to the 1996 Census of Agriculture:

Between the 1991 and 1996 Censuses of Agriculture, taxation data trends were used to calculate the commercial feed expense estimate. The census carried a question allowing the separation of commercial feed expenditure from total feed expenditure. Intercensal revisions reflect the change in the commercial to total feed expenditure ratio, along with the change in the level between the two censuses.

Impact on:

- Commercial Feed: +\$53.9 million
- Total Operating Expenses: +1.2%

Share Rent

Impact of benchmarking to the 1996 Census of Agriculture:

The Taxation Data Program was used as the primary source for estimating share rent during the 1991-1996 intercensal period. On tax forms, farmers are given the option of reporting share rent expenses together with the associated crop receipts or not reporting either. For this reason, tax data provide only an indication on the direction of the share rent expense. Census data were accepted for share rent for 1995 and revisions were carried back to 1991.

Impact on:

- Share Rent: -\$41.2 million
- Total Operating Expenses: -0.9%

Machinery Fuel

Impact of benchmarking to the 1996 Census of Agriculture:

The Taxation Data Program was used as the source for estimating machinery fuel. An analysis of the 1995 tax data in comparison with the results of the Census of Agriculture led to a downward revision of this item in Alberta. Tax data were inflated due to the inclusion of fuel for trucking services and custom work. The adjustment also reflects the fact that farm machinery has become more fuel-efficient.

Impact on:

- Machinery Fuel: -\$30.0 million
- Total Operating Expenses: -0.7%

Net Cash Income: +\$76.8 million (+5.7%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses

by -0.5% and farm cash receipts by +0.9%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised upward by \$76.8 million.

British Columbia**Farm Cash Receipts: +\$34.1 million (+2.2%)**Hay and Clover Receipts

Hay sales to the recreational sector (off-farm horses) have now been included back to 1991 using the Taxation Data Program. Data on sales to feedmills have been revised back to 1991 using the Taxation Data Program due to limitations in the previous data source.

Impact on:

- Hay and Clover Receipts: +\$7.6 million
- Total Farm Cash Receipts: +0.5%

Forest Product Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Forest Product Receipts: +\$7.0 million
- Total Farm Cash Receipts: +0.4%

Miscellaneous Crop Receipts

The revisions are due to updating the percentage used to estimate miscellaneous crop receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Crop Receipts: +\$6.0 million
- Total Farm Cash Receipts: +0.4%

Other Berries and Grapes Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Other Berries and Grapes Receipts: +\$4.4 million
- Total Farm Cash Receipts: +0.3%

Floriculture, Nursery and Sod Receipts

The revisions are the result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Floriculture, Nursery and Sod Receipts: +\$4.0 million
- Total Farm Cash Receipts: +0.3%

Miscellaneous Livestock Receipts

The revisions are due to updating the percentage used to estimate miscellaneous livestock receipts as a result of benchmarking to the 1996 Census of Agriculture.

Impact on:

- Miscellaneous Livestock Receipts: +\$4.0 million
- Total Farm Cash Receipts: +0.3%

Farm Expenses: +\$41.0 million (+3.1%)

Fertilizer and Lime

Impact of change in source data and benchmarking to the 1996 Census of Agriculture:

The Greenhouse, Sod and Nursery Industries Survey was used to verify the Census and Taxation data. It was found that the Census and the Taxation data included some interfarm sales along with fertilizer bought for retail sales and double counting large enterprises. The census data for fertilizer and lime expenses were adjusted downward, using information from the Greenhouse, Sod and Nursery Industries Survey, to eliminate the interfarm sales, retail sales and double counting in large enterprises.

Impact on:

- Fertilizer and Lime: -\$17.6 million
- Total Operating Expenses: -1.3%

Twine, Wire and Containers

Impact of benchmarking to the 1996 Census of Agriculture:

Increased use of plastic wrap for hay and other field crops, the trend toward more direct retailing by agricultural producers and the rapidly expanding greenhouse industry resulted in an increase of more than 250% in the twine, wire, and containers since 1985. This rapid increase was not reflected in the Taxation Data Program estimates and the Farm Input Price Index, the main contributors to calculating the expense estimate for this item.

Impact on:

- Twine, Wire and Containers: +\$16.3 million
- Total Operating Expenses: +1.2%

Cash Wages

Impact of change in source data and benchmarking to the 1996 Census of Agriculture:

The Greenhouse, Sod and Nursery Industries Survey was used to identify the inclusion of the non-agricultural, retail cash wage component in the 1996 Census of Agriculture. The Greenhouse, Sod and Nursery Industries Survey ratio of wages to area under glass was applied to the census estimate of area under glass to obtain the non-

agricultural wages in the greenhouse sector. This was then subtracted from the census estimate.

Impact on:

- Cash Wages: +\$14.5 million
- Total Operating Expenses: +1.1%

Net Cash Income: -\$6.9 million (-2.8%)

Improved coverage, concept, method and source changes plus the benchmarking to the 1996 Census of Agriculture data impacted on estimates of farm expenses by +3.1% and farm cash receipts by +2.2%. However, because net cash income is calculated residually, the changes have a disproportionately larger effect on this estimate. In 1995, the net cash income estimate was revised downward by \$6.9 million.

Impact of using the North American Industry Classification System (NAICS)

Statistics Canada has been using the 1980 Standard Industrial Classification system (SIC) for collecting, compiling and disseminating economic statistics on Canada's businesses. Beginning with the 1997 reference year, the North American Industry Classification System (NAICS), which includes hatcheries and farms with only Christmas trees in the agricultural sector, was introduced. The impact of this added less than 1% to farm cash receipt and total operating expenses.

Aquaculture is also part of the agriculture sector under NAICS. A separate aquaculture value added account appears in this publication. It has been compiled based on the 1997 Unified Enterprise Survey and other data.

Changes to 1997 Farm Cash Receipts

Classification changes affected receipts for three commodities. Christmas trees were added as a new commodity using the National Forestry Database, Taxation Data Program, and the 1996 Census of Agriculture to derive estimates. Hatchery receipts were estimated using Agriculture and Agri-Food Canada data on interprovincial movements and exports of chicks and poults and prices from several sources. With hatcheries becoming part of the agricultural sector, receipts from the sales of eggs to hatcheries in the same province are now considered inter-farm sales and are removed from the estimate. Only sales to hatcheries outside of the province are counted.

Farm cash receipts were 0.2% lower as a result of the classification changes. The addition of Christmas tree and hatchery (chicks and poults) receipts was more than offset by the removal of inter-farm sales of hatching eggs.

Impact on Farm Cash Receipts:

- Christmas tree receipts: +\$58.5 million
- Hatchery receipts: +\$30.6 million
- Eggs for hatching receipts: -\$141.0 million
- Net impact: -\$51.9 million

Changes to 1997 Farm Operating Expenses

Operating expenses (wages, fuel, electricity, etc.) of hatcheries and farm operations with only Christmas trees were added to the expenses. The bases for these estimates were the 1996 Census of Agriculture and the Taxation Data Program. With hatcheries becoming part of the agriculture sector, poultry purchase expenses fell. Intraprovincial purchases of both eggs by hatcheries and chicks by poultry and egg farms became interfarm purchases and were removed from the estimate. Data on interprovincial movements and imports of chicks and poults provided by Agriculture and Agri-Food Canada were used to remove these interfarm purchases.

These changes resulted in a 0.2% drop in operating expenses after rebates.

Impact on Farm Operating Expenses:

- additional operating expenses: +\$267.8 million
- changes to poultry purchases: -\$326.3 million
- Net impact: -\$58.5 million

Changes to 1997 Net Cash Income

The overall impact of the inclusion of hatcheries and farms specializing in Christmas tree production increased net cash income by 0.1 %. The magnitude of the impact should not be interpreted as the sum of net cash income from hatcheries and farms with only Christmas tree operations. Many expense estimates are based on farm-level data from the Census of Agriculture and the Taxation Data Program. Due to the difficulty in identifying and removing expenses related to hatchery and Christmas tree production on farms that produce other commodities, some expenses associated with this production were already in the estimates prior to the introduction of NAICS. As well, some receipts from hatchery and operations with only Christmas trees (e.g., program payments, poultry and egg receipts in the case of integrated hatchery operations) will have already been included in the pre-NAICS data series.

Accordingly, in those provinces where the impact of implementing NAICS is negative, the inference should not be made that hatchery and operations with only Christmas trees are receiving negative cash flows. The negative impact is more likely a factor of more receipts than expenses being included in the SIC-based estimates.

Other Changes

Based on capital value data from the 1996 Census of Agriculture, depreciation charges increased by less than 1% as a result of the introduction of NAICS.

Impact of including NAICS on receipts, expenses and net cash income: 1997

	Farm cash receipts			Operating expenses			Net cash income
	Receipts added	Interfarm sales (eggs for hatching)	Total change	Expenses added	Interfarm purchases (eggs and chicks)	Total change	Total change
	('000 of dollars)			('000 of dollars)			('000 of dollars)
Atlantic provinces	22,371	-10,218	12,153	28,509	-13,313	15,196	-3,043
Quebec	32,114	-40,118	-8,004	89,166	-83,892	5,274	-13,278
Ontario	24,159	-42,450	-18,291	107,308	-115,600	-8,292	-9,999
Manitoba	5,958	-7,616	-1,658	11,998	-22,634	-10,637	8,979
Saskatchewan	701	-4,311	-3,610	4,055	-6,925	-2,870	-740
Alberta	1,795	-16,163	-14,368	14,463	-36,176	-21,713	7,345

CANADA	89,073	-141,022	-51,949	267,828	-326,333	-58,505	6,556

Note: NAICS includes everything which was in the Agriculture sector of the 1980 Standard Industrial Classification (SIC)
plus hatcheries and farms with only Christmas trees

NET FARM INCOME

In this publication annual estimates of net farm income at the provincial and national levels are presented from 1926 to date. Estimates of net cash income, realized net income and total net income are published for 1971 to date. For 1926 to 1970, estimates of realized gross income, realized net income, total gross income, and total net income have been published. Newfoundland estimates begin with 1972. The estimates are on the CANSIM database.

Due to changes in the concepts and methods for the components of net income, estimates of net income before 1971 are not comparable with those from 1971 to date.

The notes on concepts and methods for each of the components of net farm income (farm cash receipts, farm operating expenses and depreciation charges, income in kind, and value of inventory change) should be read in conjunction with these notes.

The Agriculture Division of Statistics Canada also derives estimates of farm income from several other independent sources. The Farm Financial Survey (FFS), the Taxation Data Program, and the Census of Agriculture each produce separate income estimates. The table below shows the differences between the data.

Example:

Net Cash Income, Canada, 1995, \$Millions

Census of Agriculture	\$5,560
Farm Financial Survey	\$6,463
Agriculture Economic Statistics	\$5,949

Concepts

The farm income accounts are designed to provide an annual measure of income returned to the owners of agricultural businesses from the production of agricultural commodities. Two points should be noted:

1. These accounts only relate to the farm business. They do not include any income that farm operators or their families may receive from other sources (wages and salaries, investment income, etc.).
2. The accounts pertain only to the production and marketing of agricultural commodities. Revenue or expenses related to the sale or purchase of farm capital (real estate, machinery and equipment) are not included. Currently, the accounts include the sale of any production from farm woodlots, but exclude any

income earned from activities such as fish farming or the non-agricultural use of the farm.

Methods and Data Quality

Three measures of net farm income at the provincial and national levels have been estimated for the years 1971 to date:

a) **Net cash income** of farm businesses is derived by subtracting operating expenses from farm cash receipts. It represents the amount of cash generated by the farm business that is available for debt repayment, investment or withdrawal by the owner.

b) **Realized net income** of farm businesses starts with net cash income. It is derived by subtracting depreciation (economic concept) and adding income in kind to net cash income. It represents the financial flows, both cash and non-cash, attributable to the farm businesses, similar to an income statement. It represents the net income from transactions in a given year in that it includes the sale of commodities regardless of the year they were produced. Realized net income does not account for stock changes (value of inventory change).

c) **Total net income** is net cash income adjusted for the value of inventory change, depreciation (economic concept) and income in kind. It represents the return to owner's equity, unpaid labour, management and risk. Total net income accounts for agriculture economic production during the year that the agricultural goods were produced.

As a result of the residual method used to derive net income, a minor change in either farm cash receipts or farm operating expenses will have a significant impact on the net income level and yearly change. The following diagram illustrates this point:

Example:

Cash receipts	60,000	+1%=	60,600
- Operating expenses	<u>45,000</u>	-1%=	<u>44,550</u>
= Net cash income	15,000		16,050 = 7%
+ Income in kind	500		500
- Depreciation	<u>2,000</u>		<u>2,000</u>
= Realized net income	13,500		14,550 = 8%
+ Value of inv change	<u>500</u>		<u>500</u>
= Total net income	14,000		15,050 = 8%

In this example, a 1% change in either cash receipts or operating expenses would have resulted in a 4 to 5% change in any of the net farm income estimates, and a 1% change in both results in at least an 8% change to the total net income.

FARM CASH RECEIPTS

This publication presents calendar year estimates of aggregate farm cash receipts from 1926 to date in the net income tables. The publication also contains annual farm cash receipts by commodity, beginning in 1947, for every province except Newfoundland. Data for Newfoundland are only available from 1972. However, since Newfoundland's agricultural production is small, this break is not significant at the Canada level. For the period 1950 to 1970, data are also available through the CANSIM database on a monthly basis and on a quarterly basis for the period 1971 to date.

Concepts

Farm cash receipts represent the cash income received from the sale of agricultural commodities as well as direct program payments made to support or subsidize the agriculture sector.

The farm cash receipts series includes agricultural products such as field crops, vegetables, fruits, floriculture and nursery products, sod, maple and forest products, livestock, dairy products, poultry, eggs, wool, fur, and honey.

The direct program payments to producers included in farm cash receipts represent the amounts paid under various **government** and **private** programs to individuals involved in agricultural production. The payments related to current agricultural production include subsidies to encourage production or to compensate producers for low market returns, payments to stabilize incomes and payments to compensate producers for crop or livestock losses caused by extreme climatic conditions, disease or other reasons.

The primary reason for compiling farm cash receipts is to estimate, on a provincial basis, the agriculture sector's contribution to gross domestic product. Consequently, all inter-farm sales within a province are excluded from farm cash receipts estimates as their inclusion would result in double counting. It should be noted, however, that farm-to-farm sales between provinces are included as are all sales outside the sector. Excluding inter-farm sales within a province means that farm cash receipts cannot be used as a measure of the gross output of the agriculture sector.

Farm cash receipts are estimated on a cash basis and represent the value of sales when they occur, that is, when ownership first changes hands. Thus, sales are only recorded when cash disbursements have actually occurred. The prices used to value transactions include any bonuses and premiums which can be attributed to specific commodities, but exclude fees deducted before the producer is paid (e.g. storage, transportation, marketing or administrative costs).

In several cases, particularly where crops are concerned, producers receive a partial or an initial payment for their commodities at the time of sale. As the marketing of the crop progresses, an adjustment or final payment is made. These payments are only shown in cash receipts when producers receive the funds. Examples of such cases include Ontario Wheat Producers' Marketing Board (OWPMB) and Canadian Wheat Board (CWB) adjustment, interim and/or final payments for wheat, oats and barley. Oats ceased to be marketed through the CWB on July 31, 1989. Similar payment patterns also occur for sugar beets and dry beans.

Receipts from the sale of some agricultural products can be deferred. For example, producers in Western Canada have the option of deferring grain receipts to the next year. In the past, Statistics Canada used the assumption that payments ("liquidations") of deferred grain and oilseed receipts ("deferments") from the crops sold in one calendar year were all received in January of the following year. After conducting an examination of records provided by elevators, it was established that it was true for 90 to 95% of the cases. The series were revised accordingly, starting with 1998 data, to record more accurately in which month the liquidations occurred.

All published commodity receipts represent receipts from the market. Thus, any subsidy or stabilization payment directed at a specific commodity is not included in the receipts for that commodity. In fact, all direct subsidies or payments to the agriculture sector are recorded separately.

Methods

Cash receipts are, for the most part, based on monthly marketings and prices of the various commodities. Direct program payments are based on data obtained from several sources on a monthly or quarterly basis.

Calculations of commodity cash receipts involve the use of many data sources which can vary by province and by commodity. Most of the prices for the monthly marketings are collected from administrative sources such as marketing boards, regulatory agencies and market information. Some prices are also provided by a monthly farm prices survey conducted by Statistics Canada. In all cases, the prices reflect those received by producers at the point when ownership first changes hands.

Monthly marketings are mostly obtained from administrative records of marketing boards, government agencies and private companies. Grain marketings, including durum wheat, wheat excluding durum, oats, barley, rye, flaxseed and canola for the Western provinces, are obtained from the Canadian Grain Commission. In Eastern Canada, the data are either obtained from marketing boards and producer associations, based on historical marketing patterns or agreed upon in consultation with provincial specialists.

Marketings for crops such as corn, soybeans, tobacco, sugar beets and dry beans are obtained from marketing boards and associations as well as private companies. Cash receipts estimates for potatoes, fruits, vegetables, honey, maple and forest products, and greenhouse and nursery products are obtained through various surveys or censuses conducted by Statistics Canada, the provinces or other federal and provincial departments or agencies. These departments and agencies are also a major source of marketing data for mustard seed, sunflower seed, lentils, canary seed, dry peas, forage and grass seed, and hay and clover.

Livestock marketings, including cattle, calves, hogs, sheep, lambs, hens and chickens, and turkeys, are mainly based on market information from Agriculture and Agri-Food Canada and provincial departments and agencies. Marketings of eggs are also obtained from these sources. In the case of dairy products, producers' marketings of milk and cream are obtained from regulatory agencies and private companies.

Although the farm cash receipts series covers many commodities, it is not exhaustive. There is a miscellaneous category for crops and another for livestock. The cash receipts in these two categories are based on the quinquennial Census of Agriculture in order to account for commodities that are not estimated individually.

Since cash receipts are estimated on a cash basis, any amounts received after the sale of a product, whether in the form of a final or an adjustment payment, will be shown when the cash is received rather than when it was earned. Several items fall into this category, including payments by the CWB and the OWPMB, as well as deferments and liquidations of grain receipts. The information for these payments are obtained directly from the administrative bodies involved.

Direct program payments are tabulated quarterly. The agencies responsible for the disbursement of payments under the various programs provide the data on a monthly, quarterly and, in some cases, an annual basis. Only payments directly provided to producers are included in the series. These include payments under the Farm Income Protection Act (for the Gross Revenue Insurance Plan and the Net Income Stabilization Account), the Crop Insurance Act, the Western Grain Stabilization Act, the Agricultural Stabilization Act, Tripartite Plans, Provincial Stabilization Programs, the Canadian Dairy Commission Act and those made under ad hoc government programs.

Payments made under private programs such as private hail insurance and livestock insurance are included in the Farm Cash Receipts series under the categories "Crop insurance payments" and "Other payments", respectively. In the Direct Program Payments section of this publication, "Crop insurance payments" and "Other payments" do not include private program payments.

Data Comparability

The farm cash receipts series before and after January 1971 are not comparable. Modifications have been made to the series in terms of format, content and concepts. Consequently, the preceding documentation is only relevant for the period 1971 to date. The following is a list of the changes made to the cash receipts series effective January 1971.

- Cash advances and repayments under the Prairie Grain Advance Payments Act and the Advance Payments for Crops Act were removed from the series.
- Wheat receipts were disaggregated into wheat excluding durum and durum wheat receipts.
- Estimates were published for commodities previously included in the "miscellaneous crops" category such as lentils and canary seed.
- Fruit receipts were disaggregated into four separate categories.
- All direct payments enhancing receipts were grouped together. Farm cash receipts are presented with three sub-groupings - crops, livestock and payments.
- Poultry receipts have been disaggregated into hens and chickens, and turkey receipts.

Two new commodities were added to farm cash receipts effective January 1997 under the new North American Industry Classification System (NAICS): Christmas trees and poultry hatcheries. Refer to the section on the Impact of using NAICS for further explanation (page 16).

With poultry hatcheries becoming part of the agriculture sector:

- Inter-provincial sales and exports of chicks and poults are included in poultry hatchery receipts.
- Eggs sold to hatcheries in the same province are now considered as inter-farm sales and were removed from egg receipts.
- Inter-provincial sales and exports of eggs sold for hatching are still included in egg receipts along with receipts for table eggs.

As of the June 1999 intercensal revision, horse receipts are estimated using slaughter data from the Canadian Food Inspection Agency combined with international exports of slaughter horses.

Data Quality

As indicated above, farm cash receipts are estimated using both administrative and survey sources of data. Where necessary, data are adjusted to ensure conceptual consistency with the receipts series. Much of the data obtained from administrative sources have been summarized from the financial transactions of individual producers. These summarized data are often subject to audit by independent professional accountants and/or are used to make payments to individual producers. As a

result, the quality of these data is considered to be very good. The survey data used in the receipts series reflect typical Statistics Canada standards for quality assurance and, therefore, the quality of these data is considered to be good.

However, it is important to note that the receipts data are subject to error. Administrative data may contain non-sampling error such as keying mistakes, while survey data may suffer from both non-sampling and sampling error. Users should also note that the quality of individual estimates may not be consistent between commodities or between provinces because the data sources and their quality may vary. As well, the estimates of inter-farm sales between provinces are not strong as there are few sources for these data.

More detail on the quality of the crops and livestock data that are used to estimate farm cash receipts can be found in the following Statistics Canada publications.

1. Field Crop Reporting Series, Cat. No. 22-002-XPB/XIB
2. Grain Trade of Canada, Cat. No. 22-201-XPB
3. Cereals and Oilseeds Review, Cat. No. 22-007-XPB/XIB
4. Canadian Potato Production, Cat. No. 22-008-UPB/UIB
5. Fruit and Vegetable Production, Cat. No. 22-003-XIB
6. Greenhouse, Sod and Nursery Industries, Cat. No. 22-202-XIB
7. Survey of Canadian Nursery Trades Industry, Cat. No. 22-203 (Combined with Cat. No. 22-202-XIB since 1995)
8. Production and Value of Honey and Maple Products, Cat. No. 23-221-XIB
9. Livestock Statistics, Cat. No. 23-603-XPE/UPE
10. The Dairy Review, Cat. No. 23-001-XPB/XIB
11. Production of Poultry and Eggs, Cat. No. 23-202-XIB
12. Farm Product Price Index, Cat. No. 21-007.

Data Revisions

Annual farm cash receipts data are published twice each year, at the end of May and at the end of November. In May, receipts for the previous two calendar years are subject to revision. In November, receipts for the previous three years may be revised. Every five years a historical revision is done based on the results of the Census of Agriculture. The results of the latest intercensal revision, based on the 1996 Census of Agriculture, have been included with the June 1999 supplement, and apply to the period 1986 to 1998.

An indication of the expected size of revisions to farm cash receipts can be provided by a statistic known as Theil's Root Mean Square Prediction Error (RMSPE). This statistic represents the average percent difference

between the initial and current estimates during the period in question. For example, the table below indicates that, from 1991 to 2000, total farm cash receipts at the Canada level have so far been revised, either up or down, by about 2.1% from the first published estimate.

	RMSPE 1991-2000
Total receipts	2.1%
Crop receipts	3.3%
Livestock receipts	1.2%
Payments	12.8%

Further information on Theil's RMSPE is available from [A Description of Theil's RMSPE Method in Agricultural Statistical Forecasts](#), Stuart Pursey, Working Paper #1, Agriculture Division, Statistics Canada, 1980.

INCOME-IN-KIND

Annual income-in-kind estimates, at an aggregate level, are available in this publication in the net income tables. They are presented by province for the period 1926 to date with the exception of Newfoundland, which begins in 1972. Since Newfoundland's agricultural production is small relative to the sector as a whole, this break is not significant at the Canada level. Estimates by commodity are available on the CANSIM database.

Concepts

The income-in-kind series measures the value of agricultural commodities produced on farms and consumed by individuals living on these farm operations. The home-consumed products are valued at prevailing market prices such that income-in-kind represents the receipts producers would have received had the product been sold rather than consumed. Agricultural products that are used as inputs in the production of other agricultural products, such as grain fed to livestock, are not considered as income-in-kind because they form part of the value of the final product.

Agricultural commodities included in the income-in-kind series are dairy products, cattle, calves, hogs, lambs, hens and chickens, turkeys, eggs, potatoes, vegetables, fruits, maple products, honey, wool and forest products.

Methods

Income-in-kind estimates are derived using three different methods, depending on the commodity. For maple products and wool, estimates of the quantities consumed by farm operators and their families are obtained through surveys.

Estimates of quantities consumed for the other commodities (dairy products, cattle, calves, hogs, sheep, lambs, hens and chickens, turkeys, eggs, potatoes, vegetables, fruits and honey) are based on the number of farm operations producing the item, their average farm family size and the average annual Canadian consumption of the commodity.

Beginning in 1986, a new method for calculating income-in-kind was used for meat products (beef, veal, pork and lambs). Income-in-kind for the above listed livestock is derived by the "killed and eaten on the farm" estimates published in the *Livestock Statistics* (Cat. No. 23-603-XPE) multiplied by the annual average slaughter prices.

As of 1986, income-in-kind for forest products are based on the number of farm households, annual consumption of wood cords per farm and the average annual price.

Once the quantities of the farm products consumed by producers and their families have been established, they are valued at weighted average market prices received for the product during the year from the farm cash receipts series.

Data Comparability

The preceding documentation is relevant for the period 1986 to date for meat and forest products and 1981 to date for the other commodities. Prior to 1981, the estimates were, for the most part, based on a survey conducted in 1958 or residually derived from balance sheets. In the case of dairy products, potatoes, vegetables and fruits, the income-in-kind estimates were smoothed out between 1971 and 1980 in order to gradually blend in the impact of the method differences.

Data Quality

Estimates of the value of income-in-kind are prepared using a combination of surveys, Census and administrative data. These data reflect typical Statistics Canada standards for quality assurance and, therefore, their quality is considered to be good. However, since little information on the consumption patterns of farm families exists, it is not possible to objectively validate the income-in-kind estimates. As a result, these estimates cannot be considered to be of high quality. Furthermore, they are subject to the general sampling and non-sampling errors present in all types of survey and administrative data.

More detail on the quality of the data that are used to estimate income-in-kind can be found in the following Statistics Canada publications.

1. *The Dairy Review*, Cat. No. 23-001-XPB/XIB
2. *Livestock Statistics*, Cat. No. 23-603-XPE/UPE
3. *Production of Poultry and Eggs*, Cat. No. 23-202-XIB
4. *Canadian Potato Production*, Cat. No. 22-008-UPB/UIB
5. *Fruit and Vegetable Production*, Cat. No. 22-003-XIB
6. *Food Consumption in Canada, Part I and II*, Cat. No. 32-339-XPB/XIB and 32-230-XPB/XIB
7. *Production and Value of Honey and Maple Products*, Cat. No. 23-221-XIB
8. *Agricultural Profile of Canada*, Cat. No. 95-356-XPB
9. *Farm Product Price Index*, Cat. No. 21-007.

Data Revisions

Annual estimates of income-in-kind are published twice each year, at the end of May and at the end of November. In May, data for the previous two calendar years are subject to revision. In November, data for the previous three years may be revised. Every five years a historical revision is done based on the results of the Census of Agriculture. The results of the latest intercensal revision, based on the 1996 Census of Agriculture, have been included with the June 1999 supplement, and apply to the period 1986 to 1998.

An indication of the expected size of revisions to income-in-kind can be provided by a statistic known as Theil's Root Mean Square Prediction Error (RMSPE). This statistic represents the average percent difference between the initial and current estimates during the period in question. For example, the table below indicates that, from 1990 to 1999, the total value of income-in-kind at the Canada level has so far been revised, either up or down, by about 47.6% from the first published estimate. This result was mainly due to the change of method for calculating income-in-kind for meat and forest products. Prior to the June 1999 revision, RMSPE from 1988 to 1997 was estimated at 3.0%.

	RMSPE 1990-1999
Income-in-kind	47.6%

Further information on Theil's RMSPE is available from A Description of Theil's RMSPE Method in Agricultural Statistical Forecasts, Stuart Pursey, Working Paper #1, Agriculture Division, Statistics Canada, 1980.

VALUE OF INVENTORY CHANGE

This publication presents annual estimates of the aggregate value of inventory change from 1926 to date in the net income tables. Data for Newfoundland are only available from 1972. However, since Newfoundland's agricultural production is small, this break is not significant at the Canada level. The data series, by item, are available on the CANSIM database by province for the period 1951 to date.

Concepts

The value of inventory change measures the value of the change in producer-owned inventories between the beginning and the end of the calendar year. The annual value of inventory change (whether positive or negative), along with farm cash receipts and income-in-kind, represents the gross value of agricultural production.

Many agricultural commodities, particularly grains, are produced in a given year and stored or held until they are marketed as long as two years later. In years of above-average production, farm inventories tend to be built up, only to be drawn down and sold when production returns to average or below-average levels.

Receipts from the sale of grains can be deferred and then cashed or liquidated in the next year. As a result of the methods used to derive grain receipts, an adjustment is made to the value of inventory change. The adjustment is required in order to avoid double counting in the value of inventory change series.

The value of inventory change is estimated for durum wheat, wheat except durum, oats, barley, rye, corn, flaxseed, solin, canola, soybeans, potatoes, tobacco, mustard seed, sunflower seed, lentils, canary seed, dry peas, cattle, calves, sheep and lambs, hogs, hens and chickens, and turkeys. Deferred grain receipts and liquidations of deferred grain receipts, as mentioned above, are also included.

Methods

The value of inventory change series is an estimate of the value of the change in producer-held inventories of agricultural products during a calendar year. The physical change in inventories is valued at weighted average annual market prices in the case of crops and at simple average annual prices for livestock commodities. This simple average is based on the value per animal at January 1, July 1 and December 31 of each year.

In the case of crops, supply and disposition balance sheets are used to establish the beginning and ending inventories on a calendar year basis. Inventories at the end of each crop year and production levels for each crop are based on producer surveys. Monthly disposition items, including marketings, home consumption, feed,

waste and dockage, and seed use, are obtained from various sources.

Physical inventory levels at calendar year-end are established for each crop by adding estimates of crop year beginning inventories to estimates of production and then deducting estimates of monthly disposition.

Physical inventory levels for livestock items are established from the quinquennial Census of Agriculture. Between Censuses, semi-annual producer surveys are used to derive inventory levels.

As explained above, the value of inventory change is adjusted to take into account the deferment and liquidation of grain receipts. This adjustment consists of adding to the value of inventory change an amount equal to that shown for deferred grain receipts. Similarly, an amount equal to the value of liquidations is deducted from the value of inventory change.

Data Comparability

The preceding documentation is only relevant for the period 1971 to date. The value of inventory change series prior to 1971 is not comparable to the series after 1971. Modifications were made in terms of format and content. The following is a list of the changes made effective January 1971.

- Cash advances and repayments under the Advance Payments for Crops Act and the Prairie Grain Advance Payments Act were removed from the series.
- The value of inventory change for wheat was disaggregated into one value for durum wheat and one for wheat excluding durum.
- The value of inventory change for poultry was disaggregated into one value for turkeys and one for hens and chickens.

Data Quality

As indicated above, estimates of the value of inventory change are prepared using both administrative and survey data. These data reflect typical Statistics Canada standards for quality assurance and, therefore, their quality is considered to be good. However, it is important to note that these data are subject to the general sampling and non-sampling errors present in all types of survey and administrative data.

Estimates of the value of inventory change can also be very volatile. Inventory change can be either positive or negative, depending on whether inventories have increased or decreased. Revisions to any of the supply or disposition items will have a direct effect on inventory levels, and even small revisions could change the sign on inventory change. Furthermore, calendar year inventory levels are often derived residually. As a result, the value

of inventory change series is very sensitive and often subject to substantial revision.

More detail on the quality of the data that are used to estimate the value of inventory change can be found in the following Statistics Canada publications.

1. Field Crop Reporting Series,
Cat. No. 22-002-XPB/XIB
2. Grain Trade of Canada,
Cat. No. 22-201-XPB
3. Cereals and Oilseeds Review,
Cat. No. 22-007-XPB/XIB
4. Canadian Potato Production,
Cat. No. 22-008-UPB/UIB
5. Livestock Statistics,
Cat. No. 23-603-XPE/UPB
6. Production of Poultry and Eggs,
Cat. No. 23-202-XIB
7. Farm Product Price Index,
Cat. No. 21-007.

Data Revisions

Annual estimates of the value of inventory change are published twice each year, at the end of May and at the end of November. In May, data for the previous two calendar years are subject to revision. In November, data for the previous three years may be revised. Every five years a historical revision is done based on the results of the Census of Agriculture. The results of the latest intercensal revision, based on the 1996 Census of Agriculture, have been included with the June 1999 supplement, and apply to the period 1986 to 1998.

An indication of the expected size of revisions to the value of inventory change can be provided by a statistic known as Theil's Root Mean Square Prediction Error (RMSPE). This statistic represents the average percent difference between the initial and current estimates during the period in question. For example, the table below indicates that, from 1990 to 1999, the value of inventory change at the Canada level has so far been revised, either up or down, by about 55.0% from the first published estimate.

RMSPE
1990-1999

Value of Inventory Change	55.0%
------------------------------	-------

Further information on Theil's RMSPE is available from A Description of Theil's RMSPE Method in Agricultural Statistical Forecasts, Stuart Pursey, Working Paper #1, Agriculture Division, Statistics Canada, 1980.

FARM OPERATING EXPENSES

National and provincial level estimates of farm operating expenses and depreciation charges from 1926 to date, by type of expense, are included in this publication. There was little impact on the series when Newfoundland estimates began in 1972, as they represented only 0.2% of the total Canada expense estimate. The estimates are presented net of rebates from 1926 to 1970. From 1971 to date, gross expenses, and rebates (where applicable) are shown for each item. Net expenses and rebates are available on CANSIM.

Preliminary estimates of a calendar year are published in June of the following year (i.e. six months after the end of the reference year). The December issue revises these estimates to incorporate data received too late to be included in the first release, data revisions received from administrative source agencies, and to incorporate estimates from the Taxation Data Program (TDP), based on 60 to 80% of the sample. Updates based on the 100% TDP sample are incorporated into the issue released the following June (i.e. 18 months after the end of the reference year).

Concepts

Estimates of farm operating expenses represent business costs incurred by farm operators for goods and services used in the production of agricultural commodities. All expense information is on a calendar year basis. If direct rebates are paid to farmers to reduce the cost of particular inputs, then the net expense estimates are used in the preparation of net income, although both gross and net expenses may be displayed. As the objective is to produce provincial estimates of net income, flows from one farm to another are excluded from the estimates. The province can be viewed as one large farm.

Property tax estimates include municipal and school taxes on agricultural land and buildings owned and operated by farmers. They exclude property tax on land rented to others as this is not the business of producing agricultural goods. Taxes on land rented from others is also excluded as this is accounted for in rent expenses. The personal share of property taxes on the farm house is excluded.

Cash rent expenses are estimated for rent paid for land and buildings rented from the government or private sector, including other farmers. Taxes paid on property rented from others and community pasture or grazing fees are included. Quota rental and machine rental costs are excluded. **Share rent** expenses are estimated for the value of rent which is paid on a share crop basis.

Cash wages and room and board estimates include farm wage and salary expenses for hired labour. Wages for the family, including the spouse and children, are also part of this estimate. An increase in family wages would

decrease net farm income but leave family income unchanged. Employer contributions for Worker's Compensation, Employment Insurance and the Canada Pension Plan are included. A separate estimate was made for **room and board** expense prior to 1986.

Interest expense estimates are made for interest paid on all farm business loans such as mortgages or credit from suppliers and private individuals. Payments on the principal are excluded. Interest paid on land rented to others or on the personal portion of the farm house are explicitly excluded.

Repairs to buildings and fences expenses include all of the costs associated with the repair and maintenance of farm buildings and fencing, including the farm business share of the farm house. Expenses associated with capital improvements, such as renovations or alterations and new building or fence construction are excluded. A separate estimate was made for **repairs to fences** expense prior to 1986.

Electricity and telephone expenses are estimated for the farm business only. The personal use portion of these expenses and installation costs is excluded.

Heating fuel expenses include heating and grain drying with oil, propane, natural gas, wood and coal. The farm business share of home heating is included.

Fuel expenses include petroleum, diesel oil and lubricants used for all types of machinery and equipment from tractors and combines to generators and irrigation pumps. Only the farm business share of automobiles and trucks is included.

Machinery repair and other machinery expenses are estimated for repairs and maintenance, licence, registration and insurance costs for farm vehicles and machinery. These estimates include the cost of parts, labour and the farm business share of automobile and truck maintenance.

Fertilizer and lime expenses include all costs associated with the purchase of fertilizer and lime including spreading, if it is part of the cost. A separate estimate was made for **lime** expense prior to 1986.

The estimate for **pesticides** represents farm expenditures for all pesticides, herbicides, insecticides and fungicides. If the application of pesticides is part of the cost it is also included.

Commercial seed expenses include the value of seed and seedlings purchased by farmers through commercial channels, such as elevators, seed houses and seed dealers. The estimates exclude expenses for seed purchased from other farmers as this is an interfarm transfer in the provincial accounting system. The value of homegrown seed and the value of seed bought for resale are excluded. Seed cleaning and treatment costs are included if they are part of the purchase cost. Prior

to 1973, purchases also included nursery stock. Since 1973, farmers' purchases of nursery stock have been deducted from nursery stock receipts in the farm cash receipts account. Since 1983, only nursery stock purchases from within the same province have been deducted.

Irrigation expense estimates are for the purchase of water or water rights, and exclude the operation or purchase of irrigation equipment.

Twine, wire and containers expenses include farmers' costs for the purchase of baler twine, binder twine, baling wire, plastic wraps and containers. Containers include burlap and plastic bags, wood and cardboard boxes, plant pots and flats, egg cartons and trays, etc. Large containers, such as grain bins, are not included since these are considered capital expenditures.

Crop and hail insurance expenses include the premiums which farmers pay towards both private and government programs. Prior to 1971, crop insurance and business insurance expenses are combined in a total insurance expense. Crop insurance indemnities have been included in the cash receipts account since 1971.

Commercial feed expenses are estimated in the same manner as those for seed. Only the cost of feed and feed supplements purchased by farmers through commercial channels is included: the value of feed bought from other farmers and the value of homegrown feed are therefore excluded. Hay and straw costs are included.

Livestock purchase estimates represent only interprovincial and international trade of cattle, calves, weanling pigs and lambs moving directly to farms. Stock bought and sold between farmers in the same province are not included. From 1971 to 1996, livestock purchase estimates included poultry purchases. **Poultry purchases** represented the cost of purchasing chicks, pullets, turkeys, geese, ducks, and all other types of poultry from hatcheries. Prior to 1997, hatcheries were considered outside of the agricultural sector. With the inclusion of hatcheries in the agricultural sector, beginning in 1997, under the North American Industry Classification System (NAICS), expenses for poultry purchases have decreased. Movements of birds between farms in the same province are not included.

The **artificial insemination fees and veterinary** expenses estimates represent all costs which farmers incur when obtaining these services, such as medicine, semen, and technical or professional assistance.

Business insurance expenses for 1971 to date represent the gross amount of premiums paid to protect the capital employed in agricultural production. Estimates for earlier years are net of indemnities and are included with crop insurance expenses.

Custom work expenses are net and represent the difference between custom work expenses and custom

work receipts. They include custom work, contract work and machine hire expenses. Expenses with benefits spread out over many years such as land clearing are excluded.

Stabilization premiums are expenses which farmers pay to belong to stabilization programs.

Legal and accounting expenses are fees which are pertinent to the farming operation. Prior to 1990, legal and accounting fees were a part of **other expenses**.

Other expenses include items which are not covered elsewhere in the accounts such as office and promotion expenses. Legal and accounting fees were part of other expenses before 1990. They are now one separate item.

Methods and Data Quality

Preliminary estimates of each farm operating expense except interest, irrigation, livestock and poultry purchases, crop and hail insurance, and stabilization premiums are obtained by applying price and quantity indicators to the previous year's final estimates. Prior to 1991, most of the final estimates of farm operating expenses came from the National Farm Survey (NFS) and a sample of farmers' income tax records for unincorporated farms outside of the Prairies. From 1991 to date, the Taxation Data Program (TDP) is the main data source. The first set of estimates, based on a 60 to 80% TDP sample, are published in the December issue of the following year. Estimates based on the complete TDP sample are published in the June issue, 18 months after the end of the reference year.

In summary, during non-intercensal review periods, revisions are within 1 to 2% of the original estimate, and may cover three years preceding the reference year for the December issue, and two years for the June release. For additional information please contact the Farm Income and Prices Section (FIPS) at (613) 951-2441.

Revisions are also incorporated into this series after the results of each Census of Agriculture have been reviewed. Concepts, methods and format may also be changed at this time, to provide a historical time series which is methodologically and conceptually consistent. The most recent intercensal reviews have resulted in revisions to the estimate of total gross farm operating expenses, at the Canada level, of 0.6%. Detailed results of the most recent revisions based on the 1996 Census of Agriculture are included in the June 1999 supplement. For more information on the impact of these revisions, please see page 4.

To obtain detailed technical information on the data quality of the Taxation Data Program, whose estimates form the base of this series, users can refer either to the introduction page or to Economic Overview of Farm Incomes, Statistics Canada Catalogue 21-005-XIE.

For the other expense items (interest, irrigation, livestock and poultry purchases, crop and hail insurance, and stabilization premiums), preliminary estimates of the previous calendar year are published in the June Agriculture Economic Statistics (AES) and includes all data received from source agencies or Statistics Canada sources at the time of release. The December issue revises these to incorporate changes made by the source agencies, and to accommodate data received too late to be included in the first release.

Interest expenses are estimated from administrative data prepared by banks, credit unions, the Farm Credit Corporation, federal and provincial governments, and from Agriculture and Agri-Food Canada. The data are adjusted to conform with the required concepts. Examples of such adjustments would be converting fiscal year data to a calendar year basis, or the exclusion of the personal share portion of the interest on the house mortgage.

Irrigation expense estimates come from the Association of British Columbia Irrigation Districts, Alberta Agriculture, the Saskatchewan Water Corporation, and the Prairie Farm Rehabilitation Administration.

Livestock purchase expense estimates are based on international and interprovincial import data. The number of animals imported interprovincially and internationally is obtained from supply and disposition balance sheets published by the Livestock and Animal Products Section. The values for animals imported interprovincially are based on prices received by farmers in the exporting province, as compiled by the Prices Unit. Transportation costs between provinces, as provided by the transportation industry, are added to the livestock purchase expense. The value of animals imported internationally is calculated using International Trade Division data.

Prior to 1997, **poultry purchase** expense estimates included the cost of purchasing chicks from hatcheries. With hatcheries becoming part of the agricultural sector in 1997, only the value of chicks and hatching eggs imported interprovincially and internationally is measured. Quantities of pullet and broiler chicks, turkey poults and chicken and turkey hatching eggs are obtained from Agriculture and Agri-Food Canada. Prices are obtained from the Canadian marketing agencies for eggs, broiler hatching eggs and turkeys. International import prices are obtained through the International Trade Division, Statistics Canada.

Crop and hail insurance estimates come from the Canadian Hail Underwriters Association and Agriculture and Agri-Food Canada's administrative data.

Stabilization premium estimates are provided by Agriculture and Agri-Food Canada. The method for handling stabilization premiums was revised as part of the 1971-1987 intercensal revisions. For 1971 to date,

premiums are reported in the farm operating expenses series.

DEPRECIATION CHARGES

Concepts

Depreciation charges against the farm business are intended to account for economic depreciation or the loss in fair market value of the capital assets. Generally, depreciation is considered to occur as a result of ageing, wear and tear, and obsolescence. It represents the value of capital, which is no longer available for future use. Economic depreciation should not be confused with accounting depreciation, tax depreciation, or capacity depreciation.

Building depreciation estimates the depreciation of farm buildings on owner-occupied farms, including the farm business share of houses. The charge for building depreciation on tenant-occupied farms is assumed to be included in the cost of cash or share rent. Machinery depreciation estimates the depreciation of the farm business share of autos and trucks and the depreciation of other machinery, which are owned by the farm business. Autos, trucks and machinery, which the farmer leases, are not depreciated.

Methods and Data Quality

The depreciation on farm buildings is based on the value of farm land and buildings. Provincial owner-occupied proportions are derived from the Census of Agriculture estimates of land tenure. The proportions of houses and other buildings to land are derived from the special 1958 Farm Income and Expenditure Survey, with some adjustments prior to 1984 to account for changes in the proportions over time. The business share of the house was based on tax allowances and expert opinion. These proportions are used to derive the owner-occupied farm business share of the value of farm houses and other buildings. Depreciation is calculated using the declining balance method where the appropriate capital value is multiplied by the depreciation rate. The depreciation rate is 2% for farm houses and 5% for other buildings. It would take 80 and 31 years, respectively, to depreciate 80% of the value from any particular year, using the declining balance method.

Depreciation of autos, trucks and other farm machinery are based on their respective capital value series, using the declining balance method. Depreciation rates vary by province, but range between 9% and 17%. It would take approximately 17 and 9 years, respectively, to depreciate 80% of the value from any particular year, using this method. Only the farm business portion of depreciation on autos or trucks is included. The business share of the autos and trucks was based on tax allowances and expert opinion.

An analysis of the quality of depreciation data was done in 1994. Weaknesses which were identified and remain unresolved include: the use of the change in value of farm land and buildings to estimate farm building depreciation; the use of a conceivably outdated 1958

survey as a benchmark; the omission of fencing as depreciable capital; and the use of indirect sources of information on the proportion of owned assets to total assets. A report on the results of this analysis was prepared and is available on request.

Leasing of autos, trucks and farm machinery

Beginning in the early 1990's, the leasing of vehicles and farm machinery became increasingly common. That portion of the value of autos, trucks and farm machinery that was being leased by farmers was removed from the depreciation calculation.

Machinery and equipment is separated into five categories:

- a) autos,
- b) trucks,
- c) tractors 40 horse power (h.p.) and over,
- d) self-propelled combines,
- e) all other machinery.

The practice of leasing is most common for the first four categories (above) while "all other machinery" is, for the most part, owned outright by farmers.

Decisions made on basis of information provided by manufacturers, dealers, surveys, administrative data, etc. are as follows:

1) autos, trucks, tractors 40 h.p. and over, and self-propelled combines purchased prior to 1992 were not purchased under a lease agreement

2) 35% of the total capital value of autos, trucks, tractors and self-propelled combines on the 1996 Census was purchased prior to 1991 and only a portion of those purchased between 1991 and 1996 were leased. The capital value used in calculating depreciation was reduced when the leasing calculations began in 1992.

Autos and trucks

It is assumed that at the end of the lease agreement the lessee returns the automobile or truck to the dealer who sells them to the non-agriculture sector.

Tractors 40 h.p. and over

At the end of the lease agreement (i.e., after 3 years) either the lessee or another farmer "buys" the tractor at 62% of the original value. The "buy out" value is added back to the total value of owned machinery. It is assumed that tractors under 40 h.p. are not leased.

Self-propelled combines

At the end of the lease agreement (i.e., after 2 years) either the lessee or another farmer "buys" the combine at 50% of the original value. The "buy out" value is added back to the total value of owned machinery.

Special Notes on Farm Operating Expenses and Depreciation Charges, 1926 - 1970

Canada Total

Excludes Newfoundland prior to 1972.

Rebates

All estimates are net of any direct federal or provincial government rebates paid directly to producers.

Property Taxes

Includes taxes on owned land and buildings only.

Gross Farm Rent

Includes cash rent and share rent.

Wages to Agricultural Labour

Only total estimate available from 1926 to 1957. From 1958, cash wages and room and board are published separately.

Interest on Indebtedness

Includes interest payments on farm mortgages for owned land and buildings, together with interest payments on all other farm business debts.

Total Machinery Expenses

Only farm business expenses are included. From 1926 to 1950, total includes tractor expenses, truck expenses, engine and combine expenses, automobile expenses, machinery repair parts, and machine shop and blacksmith expenses. From 1951, two components are published: 1) gasoline, diesel fuel and lubricants, and 2) machinery repairs and other machinery expenses.

Fertilizer and Lime

Includes fertilizer only from 1926 to 1940.

Other Crop Expenses

Includes pesticides, seed and seedlings, and twine, wire and containers from 1926 to 1937, plus irrigation from 1938. From 1941 to 1947, the sum of the components of other crop expenses differs from total other crop expenses estimates for some Atlantic provinces.

Pesticides

Includes pesticides and containers from 1926 to 1947. From 1948, only pesticides included.

Seed and Seedlings

Includes purchases through commercial channels only. From 1926 to 1972, includes seed and seedlings and nursery stock.

Irrigation

Estimates are available from 1938.

Twine, Wire and Containers

Includes binder twine only from 1926 to 1944. Binder twine, baler twine and wire are included from 1945 to 1947. From 1948, binder twine, baler twine, wire and containers are included. Containers are included in the pesticides estimate from 1926 to 1947.

Feed

Includes purchases through commercial channels only.

Other Livestock Expenses

Included in miscellaneous from 1926 to 1940. From 1941, three separate components published, including livestock purchases, breed association fees and artificial insemination fees and veterinary expense.

Repairs to Buildings

Includes the farm business share of repairs to farm buildings and residences.

Electricity and Telephone

Includes farm business expenses only. Before 1941, electricity included in miscellaneous. From 1941 to 1950, includes electricity only.

Miscellaneous

Includes fence repairs from 1926-70, net custom work expenses from 1951-70, and other supplies and services not elsewhere specified from 1926. Also includes insurance expenses, which were estimated from 1951 to 1970 by summing net property, crop and hail insurance expenses, net of indemnities.

Total Depreciation

Includes estimates of the farm business share of depreciation charges on buildings, cars, trucks, and other farm machinery.

REBATES

Concepts

National and provincial estimates of rebates paid directly to farmers represent a reduction in business costs incurred in the production of agricultural commodities. Rebates, paid by various governments, are calculated on a calendar year basis. In this publication the expense items are each shown net of rebates from 1926 to 1970, but from 1971 to date, the actual rebate estimate is displayed.

Methods and Data Quality

The rebate estimates include all payments made directly to producers under federal, provincial and municipal expense reducing programs. Administrative data are obtained directly from Revenue Canada, provincial departments of agriculture and of revenue. Current rebate programs include:

Prince Edward Island:

- Lean Beef Program (livestock purchase rebate)

Nova Scotia:

- Sire Improvement Program (livestock purchase rebate)
- Agriculture Limestone Assistance Program (lime rebate)
- Loss Provision Program (interest rebate)

New Brunswick:

- Beef Producers Sire Assistance Policy (livestock purchase rebate)
- Cattle Retention Program (interest rebate)

Quebec:

- Property Tax Rebate Program
- Interest Rebate Program

Ontario:

- Motor Fuel Tax Rebate
- Direct Cash Wages Rebate

Saskatchewan:

- Farm Fuel Program

Alberta:

- Interest Rebate Program

As the data are obtained directly from those agencies administering the rebate programs, and making payments to the producers, they are deemed to be of good quality.

For more information on historical programs, please see the footnotes following the Direct Payments tables.

INDEX OF FARM PRODUCTION

In this publication, the index of farm production is presented for the years 1935 to 1985. Several different series of index numbers are included. Unduplicated indexes of grains, oilseeds, fruits, vegetables, livestock, dairy, and poultry and eggs are presented at the Canada level from 1951 to 1985. As well, unduplicated total crops, and total livestock and animal products indexes for each province and Canada are included for the years 1951 to 1985. Finally, a total index is presented for all of the provinces and Canada from 1935 to 1985. The section should be contacted to discuss the use of the CANSIM database (613-951-2441).

The methods described only apply to the data from 1951 to 1985. For these years, commodity coverage has been improved and the index has been automated. For 1935 to 1950 the old database was used. Coverage was not as complete and the index was done by hand. The methods pertaining to the years 1935 to 1950 can be found in the 1961 issue of the Index of Farm Production, Catalogue no. 21-203.

Concepts

The index of farm production measures the change, through time, in the economic production of agricultural commodities. Economic production for agriculture is defined in the National Income and Expenditure Accounts, Volume 3, Catalogue no. 13-549, to include the production of goods which are exchanged for money in the market economy plus farm products consumed directly in farm households.

It is an index of unduplicated gross farm production and, in its construction, provision was made to avoid double-counting of farm output. Within a province, such double-counting can occur when feed grains credited to field crop production are fed to livestock and appear later as livestock and livestock products. Interprovincially, this duplication can occur when feeder livestock raised in one province are shipped to another for finishing.

To avoid intraprovincial duplication, the quantities of farm products included in the index are limited to those sold by farmers (except direct interfarm sales within the province), amounts consumed in farm homes on farms where produced and amounts equal to the annual change in farm-held inventories of crops and livestock. Interprovincial duplication is largely eliminated by making adjustments for those cases where provincial agricultural production depends, in part, upon feeder livestock from other provinces. These adjustments are made before the calculation of the index numbers by deducting from total provincial production, valued in terms of base period prices, the value of any contributions from the other provinces, also in terms of base period prices.

Methods

The time base for the index of farm production is 1981 = 100. This is the former time base used in Statistics Canada indexes. Prior to this, the index of farm production had a time base of 1971 = 100.

A Laspeyres type formula was used in the construction of the index. The index expresses the gross output of agricultural production in the current period, valued in terms of base period prices, as a percentage of the gross output in the base period, also in terms of base period prices. In mathematical terms, the index formula for an individual province, or Canada, is the following:

$$\text{Index} = \frac{\sum_{i=1}^k \text{PoiQni}}{\sum_{i=1}^k \text{PoiQoi}} \times 100$$

where Poi is the base period price of commodity "i", Qoi is the base period quantity of commodity "i", Qni is the current year quantity of commodity "i", and k is the number of commodities included in the index.

A Laspeyres formula was chosen for the index of farm production for two reasons. First, a Laspeyres formula allows for year to year comparison of the index numbers. Second, most other indexes use a Laspeyres formula. The choice of this formula increases the comparability of the index of farm production with other indexes.

When choosing price weights for the index, it is important that the weights be representative of typical economic conditions in agriculture. As part of the analysis, three elements of agriculture were examined: the cattle cycle, the hog cycle, and production and prices in the grains sector. Each weighting period was examined in terms of these three factors to ensure that a period closely representing average agricultural conditions was chosen.

It is also important that the index be rebased periodically to ensure that the price weights do not become obsolete. Three weighting periods have been chosen: 1953 to 1955 (three years), 1962 to 1964 (three years) and 1971 to 1974 (four years). For each period, weighted average prices were calculated. These average prices were used to value the commodities included in the index until the next rebasing occurred. The indexes calculated on these three weighting periods were then linked together to arrive at a single index number series from 1951 to 1985.

A more recent weighting period was examined but did not yield results significantly different from the 1971 to 1974 period. It was decided to retain the 1971 to 1974 period.

The index numbers from the old database (1935 to 1939 price weights) were linked to the new database at 1951. The 1953 to 1955 weighting period was linked to the 1962 to 1964 period at 1962. The 1962 to 1964 weighting period was then linked to the 1971 to 1974 period at 1971.

To convert the index numbers from a 1971=100 time base to 1981=100, the 1971 index number for each commodity group was divided by the 1981 index number for that group (both on a 1971=100 base). The resulting ratios were then applied, by commodity group, to each index number on the 1971=100 time base.

The commodities included in the index of farm production are, with some exceptions, the same commodities that are covered in the farm cash receipts series. Floriculture, nursery, forest products and the minor commodities included in the farm cash receipts miscellaneous category are not included in the index because of limitations to the available quantity data. Commodities included in the index account for more than 95% of total farm cash receipts from farming operations for the 1971 to 1974 weighting period.

The sources of information used in the preparation of these estimates include the Census of Agriculture; periodic Statistics Canada surveys of the production and disposition of crops, livestock and animal products; farm product marketing agencies; processors of agricultural products; Statistics Canada surveys of prices received by farmers in connection with agricultural activities; and agricultural statistics arising out of the administrative responsibilities of various government departments, both federal and provincial.

The price used to value production is the transaction price received by the producer in the base period plus any payments received. Payments include Canadian Wheat Board and Ontario Wheat Producers' Marketing Board payments, deficiency payments paid by the Agricultural Stabilization Board, dairy supplementary payments, provincial income stabilization payments and other such commodity specific payments. Supplementary payments, other than dairy supplementary payments, have not been included because they are not paid on specific commodities. Payments made on a commodity are added to the value of that commodity on an accrual basis i.e., they are added to the value of the commodity in the period in which the commodity was marketed, not in the period in which the payments were received.

Since Newfoundland has been included in the index beginning with 1971, a break in the Canada series occurs at that time. However, since Newfoundland's agricultural production is not large, this break is not significant.

Index Discontinued

Users should note that estimates of the index of farm production have not been made since 1985. There are no plans to update this series.

Note to Users:

Several strengths of the current index of farm production can be identified. First, the database used to construct the index is more complete than the old database. Second, the current database is automated.

This results in much greater flexibility in choosing index formulas, weighting periods and time bases. As well, more detailed results can be produced at little additional cost. The present index has three weighting periods for thirty-five years of data. This means that the index is being rebased about every twelve years. Rebasings this often ensures that the price weights do not become obsolete. Also, the multi-year weighting periods provide more representative price weights than single-year weighting periods.

Any weaknesses that apply to the farm cash receipts series will also apply to the index of farm production. In particular, the feeder livestock inter-provincial movement data are not very complete for the years prior to 1971. As well, this index has not been adjusted for changes in the quality of farm products produced in any given year.

VALUES OF FARM CAPITAL

This publication includes 1941 to date estimates of the value of farm capital and its three components, for the provinces and Canada as at July 1 of each year. There was little impact on the series when Newfoundland estimates began in 1976, as they represented only 0.1% of Canada's total capital value estimate. These estimates are available on the CANSIM database. More detailed estimates may be obtained by contacting the Farm Income and Prices Section at (613) 951-2441.

Concepts

The value of capital estimates the market value of capital employed in the production of agricultural commodities, regardless of whether the capital is owned or leased. The three components of farm capital are: livestock and poultry, land and buildings, and farm implements and machinery.

The value of livestock and poultry estimates the market value of cattle, hogs, sheep, chickens, turkeys, mink and fox on farms. Based on the 1996 Census of Agriculture, the value of animals not included (horses, ponies, goats, rabbits, bee colonies, elk, buffalo, llamas, ostriches, etc.) is estimated to equal 9% of the published value of livestock and poultry. Horses and ponies account for 73% of the value of those not accounted for.

The value of land and buildings estimates the market value of real estate used for agricultural production. It includes the value of all property operated by the holding, whether owned or rented from others, but excludes the value of property rented to others. It also excludes the value of farm offices not located on farm holdings, even though they are assets used to produce agricultural products. The impact of this limitation on the data is considered to be insignificant.

The market value of all farm machinery and equipment on agricultural holdings is estimated, regardless of ownership. Separate estimates are made for autos, trucks and other farm machinery.

Methods and Data Quality

The numbers and values of the various components of farm capital are estimated each year, until the data become available from the succeeding Census. The estimates are then benchmarked to the Census and intercensal revisions are undertaken to adjust the estimates for the intercensal years.

The value of livestock and poultry is estimated for each province, based on farm inventories and average farm values per head for cattle, hogs, sheep, chickens, turkeys, mink and fox. Estimates of livestock numbers on farms as of July 1 are published in Livestock Statistics,

Statistics Canada Catalogue 23-603-XPE. The values per head are estimated by the Agriculture Division's Farm Income and Prices Section in consultation with provincial statisticians. The value per head estimate uses the best data available, and is deemed to be of acceptable quality.

The value of land and buildings is calculated by multiplying the value per acre of farm land and buildings by provincial estimates of the total area of land. The methods used to estimate value per acre are explained below.

Provincial estimates of the total area of land are made by multiplying the previous year's estimate by the annualized change in the total area of land between the two previous Censuses. This assumption is not unreasonable given the fact that the quantity of agricultural land is subject to only minor changes.

The values of automobiles and trucks are calculated for each province by multiplying the previous year's estimate by price and quantity change indicators. Year-over-year changes in the Farm Input Price Index (FIPI) for auto replacement and truck replacement, published by Prices Division, are used as provincial price change indicators. The quantity change indicator for automobiles and trucks is the annualized change in numbers between the two previous Censuses.

The value of other machinery is estimated using a constant dollar, perpetual inventory model which accounts for investment and depreciation. Other farm machinery is valued at the aggregate level only, as the information needed to prepare estimates by type of farm machine is not available. Estimates of national investment are made by multiplying the previous year's estimate by a change indicator which is primarily derived from data on sales of farm machinery, excluding repair parts, by Canadian Farm and Industrial Equipment Institute (CFIEI) members. CFIEI is a coalition of most of the large manufacturers of farm machinery and implements, and of other associations that represent the industry. Shipments by agricultural implement manufacturers, from the Survey of Manufactures, plus imports minus exports, are also used as indicators in estimating national investment.

National investment is allocated provincially using proportions derived from the Census of Agriculture and the biennial Financial Farm Survey. Depreciation is estimated as explained in the section "Depreciation Charges", page 29. Provincial FIPI for machinery replacement is used as the deflator to convert between constant and current values.

Investment is estimated using the value of all sales of farm machinery and equipment by manufacturers as a proxy, and may be underestimated because: 1) farmers may purchase used machinery and equipment from outside the sector; and 2) farmers may be making purchases of capital assets not classified as agricultural

implements. Although the estimate includes the value of agricultural implements sold to non-farmers, such as cemeteries, parks, and commercial or private users, these sales outside the agriculture sector account for very little of the total sales, and the overall investment estimate is judged to be underestimated.

The preliminary change indicator for investment is based on the year-over-year change of the value of CFIEI members' sales, which does not include the value of smaller, specialized manufacturers who are not CFIEI members. This change is assumed to be equivalent to the year-over-year change of the industry's sales.

The 1996 intercensal revisions increased total capital value by 3%. The value of livestock and poultry revisions increased by less than 1%. The value of land and buildings increased by 5%. Revisions to the value of machinery resulted in a 3% decrease.

Intercensal revisions undertaken after a Census of Agriculture are generally of greater magnitude than annual revisions. The Census of Agriculture may be biased in estimating the market value because of the difficulties to respondents in accurately estimating the present market value of their assets. However, the Census of Agriculture estimates are considered to be the best available.

VALUE PER ACRE OF FARM LAND AND BUILDINGS

National and provincial estimates of the value per acre at July 1 are included in this publication for 1921 to date. Newfoundland estimates begin in 1976. These estimates are on the CANSIM database.

Concepts

Value per acre of farm land and buildings reflects the value of all farm land, including pasture and unimproved land, plus the value of farm houses, buildings, and other structures.

Methods and Data Quality

The value of farm land per acre is estimated for each province by multiplying the previous year's estimate by the change ratios obtained from the Farm Credit Corporation's (FCC) survey of farm land values.

This FCC survey monitors bare land values in each province. Representative parcels of bare land are selected according to the most prevalent agricultural classes of soil in each Census district. Urban fringe areas are excluded from the sample. A weighting factor is then assigned to each of these properties, based on

the improved land area from the most recent Census. Survey estimates are updated by FCC staff every six months, using the most recent comparable farm land sales.

This survey considers the value of the land, not the value of the buildings, which may introduce a bias into the indicators. In addition, the exclusion of urban fringe land may affect both the change in value and the level of the estimate, as urban fringe lands are more valuable, and also may be subject to more price volatility. Comparison to the 1996 Census of Agriculture indicates that the value of land and buildings was underestimated by nearly 5%. This was particularly noticeable in Prince Edward Island, New Brunswick and British Columbia, which were underestimated by 18%, 11% and 9% respectively.

For more information on the impact of 1996 intercensal revisions, please see page 4.

FARM DEBT OUTSTANDING

National and provincial level estimates of farm debt outstanding, by type of lender, are included in this publication for 1971 to date. The impact of including Newfoundland estimates beginning in 1981 was minor as it represented only 0.08% of the total debt outstanding. These estimates are on the CANSIM database. A more detailed breakdown of farm debt outstanding (eg. classified as either mortgage or non-mortgage) may be obtained by contacting Farm Income and Prices Section (613) 951-2441.

The Farm Financial Survey (FFS) is conducted every two years. Questions are asked on financial variables, and survey results are used to verify the estimates. Although the farm debt outstanding series in this publication uses administrative data as the primary source, and the FFS collects data through a sample survey, the results of the two data sets compare favourably, once conceptual differences are reconciled.

Concepts

The farm debt series measures debt outstanding to agricultural producers as of December 31 of each year. This approach presents a problem as some institutions provide data based on a fiscal year ending March 31. For these institutions, the debt outstanding at the fiscal year-end, March 31, is used to represent the debt at December 31 of the previous year. The impact of this procedure is believed to be minor.

The estimates are produced by province and by class of lender. These classes include: chartered banks; federal government agencies; provincial government agencies; credit unions; private individuals and supply companies; insurance, trust and other companies; and advance payment programs. Loans which are merely guaranteed by an institution are not included in the debt outstanding estimate for that institution.

Methods and Data Quality

Data on farm debt outstanding provided by the Bank of Canada, the Farm Credit Corporation and the provincial and federal agencies are considered to be of very good quality at the provincial and national levels.

Data on farm debt outstanding provided by credit unions are considered to be of good quality at the national level. Except for the Atlantic provinces, the mortgage component of farm debt outstanding to credit unions is considered to be of good quality. The non-mortgage component of farm debt outstanding to credit unions is considered weak in the Atlantic provinces, Ontario and British Columbia. The Farm Financial Survey, which is conducted every two years, is used to estimate debt outstanding to private individuals and supply companies, and insurance, trust and other companies. Advance

payments are considered loans made to farmers since no transaction occurs at the time of the advance. These data are supplied by the Canadian Wheat Board and Agriculture and Agri-Food Canada and are considered of good quality at both the national and provincial levels.

Revisions to this series are minor (historically, at the Canada level, any revision to the total debt outstanding in this publication has been less than 1%), and are primarily due to amended data being received from one or more of the agencies. To comply with our publishing schedule there is occasionally need for an organization to provide us with preliminary year end figures, which are revised in the subsequent issues. Revisions are also made to the private individuals and supply companies, and insurance, trust and other company data once the results of the Farm Financial Survey (FFS) becomes available.

The Bank of Canada provides information on debt outstanding for **chartered banks**. The Bank of Canada supplies non-mortgage debt at the provincial level, and mortgage debt at the Canada level. Provincial estimates are then calculated based on the distribution pattern of non-mortgage loans.

There are several sources of information on debt outstanding for **federal government** agencies. The Farm Credit Corporation (FCC) provides estimates of loans outstanding made under the Farm Credit Corporation Act. Loan information is also provided by Business Development Bank of Canada and Veterans Affairs Canada.

Information is also gathered from many **provincial government** agencies. Newfoundland Farm Development Loan Board, Prince Edward Island Lending Agency, Nova Scotia Farm Loan Board and New Brunswick Agriculture Development Board information is obtained from the administrative data held by these agencies. In Quebec, Farm Credit Act ("Loi du crédit agricole") loan information regarding debt outstanding is mainly obtained from their annual report. The rest of the farm credit programs offered by the Quebec government are all of a guarantee nature; the province simply guarantees the borrower an interest rate or the lender against defaults. The lenders are commercial banks and near banks. Information about the Ontario Junior Farmers Establishment Program and the Ontario Tile Drainage Debenture Program is obtained from the Ontario Ministry of Agriculture, Food and Rural Affairs. The Manitoba Agricultural Credit Corporation and the Agricultural Credit Corporation of Saskatchewan both report loan information directly. Alberta Agriculture Financial Services Corporation and British Columbia Ministry of Finance and Corporate Relations loan information is obtained from the administrative data of these two agencies. Alberta Treasury information is obtained directly from that agency.

Estimates of agriculture debt outstanding to **credit unions** are based on provincial data supplied by the

Industrial Organization and Finance Division (IOFD) of Statistics Canada. IOFD conducts quarterly surveys and publishes this information at the Canada level in Quarterly Financial Statistics for Enterprises, Statistics Canada Catalogue no. 61-008.

The category **"private individuals and supply companies"** includes credit owed to machinery and finance companies, dealers, stores and private individuals. Information regarding this type of credit is based on the Farm Financial Survey (formerly FCC survey).

Insurance, trust and other unclassified company estimates are based on information from the Farm Financial Survey (formerly FCC survey).

Advance payments estimates are derived from data supplied by the Canadian Wheat Board (C.W.B) and Agriculture and Agri-Food Canada. These payments are a type of loan made to farmers since no transaction occurs at the time of the advance. Prior to 1971 the estimates are included in cash receipts under the category "C.W.B. net cash advances".

FARM PRODUCT PRICE INDEX

This publication presents the Farm Product Price Index for the years 1971 to date on a 1997=100 base. The first table includes indexes of grains, oilseeds, specialty crops, fruits, vegetables, potatoes, cattle and calves, hogs, poultry, eggs and dairy, by province and for Canada, from 1971 to date. Total crops, total livestock and the total index are also included.

The second table presents the annual data for the total index by province and for Canada from 1971 to date.

The prices used in calculating the index, additional indexes, and weighting diagrams are available by contacting the Farm Prices Unit, Farm Income and Prices Section at (613) 951-8708. Data are also available through the CANSIM database on a monthly basis or available free on the Internet at www.statcan.ca.

Concepts, Methodology and Data Quality

The following information should be used to ensure a clear understanding of the basic concepts that define the data provided in this product, of the underlying methodology of the index, and of key aspects of the data quality. This information will provide you with a better understanding of the strengths and limitations of the data, and of how they can be effectively used and analyzed. The information may be of particular importance to you when making comparisons with data from other sources of information, and in drawing conclusions regarding the significance of changes between different years, or of the differences in index movements between different regions.

Data Sources and Methodology

The Farm Product Price Index (FPPI) measures the change through time in prices received for agricultural commodities at the first transaction point.

General Methodology

The FPPI is an annually linked chain index with different index baskets for each calendar month of the year. The index expresses current farm prices as a percentage of prices prevailing in the base period.

Reference Period

The FPPI compares, in percentage terms, prices producers received in any given time period to prices in the official base year, which is 1997=100. The reference period for the data collection and compilation is the calendar month. The monthly index is released approximately eight weeks after the end of the reference month. The annual index, which is a weighted average of the monthly indexes, is released with the December index.

Weights and Linking

The FPPI is based on a five-year basket that is updated every year. This captures the continual shifts in agricultural commodities produced and sold. The annual weight base is derived from Farm Cash Receipts, Catalogue No. 21-001-XIB. There is a two-year lag in the years used to construct the basket because of the availability of farm cash receipts data and to reduce the number of revisions made to the index. Therefore, the years used to construct the basket for year y are $y-6$ to $y-2$.

The seasonal weighting pattern was derived using the monthly marketings from 1994 to 1998. These remain constant and will only be updated periodically, for instance during intercensal revisions or when the time base is revised.

The annual basket is linked into the index every year at the year and not at the month of December.

The current index is linked back to 1935.

The FPPI has undergone numerous rebasings and reweighting phases during its fifty-year history.

Date of Introduction	Basket Reference Period	Scope of Basket	Time Base
Aug. 1946	1935-1939	1935-1956	1935-1939=100
Sept. 1969	1960-1962	1957-1970	1961=100
Aug. 1978	1971	1971-1980	1971=100
Dec. 1986	1981-1984	1981-1991	1981=100
Mar. 1990	1981-1984	1991-1996	1986=100
Apr. 2001	Annually updated 5-year average	1992-	1997=100

Data are Subject to Revision

Data are subject to revision in the event of late receipt of initial or revised data.

During the current calendar year, all months within that calendar year may be subject to revisions. Twice a year, in May and November, revisions to previous years may be incorporated; the previous two years in May and the previous three years in November. Every five years, the index can undergo an historical revision, based on the results of the Census of Agriculture, which affects both prices and quantities. The monthly distribution of commodities is reviewed during the incorporation of Census revisions.

For grains delivered to the Canadian Wheat Board or the Ontario Wheat Producers Marketing Board, the retroactive inclusion of adjustment, interim or final payments may cause substantial changes to the index.

In comparing current index numbers with those prior to the final payments being accrued, the following points should be considered. Any subsequent adjustment payments are added to the prices used and the index revised upward accordingly. An increase of \$10.00 per tonne in the price of CWB wheat or barley or Ontario wheat would result in substantial upward revisions in the total indexes for Ontario and each of the Prairie provinces, in points, as illustrated below.

	Ont.	Man.	Sask.	Alta.	B.C.	Canada
Wheat	0.0	1.2	2.2	1.0	0.1	0.7
Barley	--	0.2	0.5	0.4	0.0	0.2

Seasonal Adjustment

The FPPI is not adjusted for seasonality, but the seasonal basket is used since the marketing of virtually all farm products is seasonal. The index reflects the mix of agriculture commodities sold in a given month.

Concepts and Variables Measured

Price Coverage

The FPPI includes all farm products sold off the farm, which are estimated in the farm cash receipts series published in *Farm Cash Receipts*, Catalogue No. 21-001-XIB and *Agriculture Economic Statistics*, Catalogue No. 21-603-XPE.

Prices are based on either administrative data sources, or monthly surveys of agricultural producers or commodity purchasers. Where possible, administrative data sources are used to reduce response burden. The commodity price is collected at point of first transaction, where the fees deducted before a producer is paid are excluded (e.g., storage, transportation and administrative costs), but any bonuses and premiums that can be attributed to specific commodities are included. Commodity-specific program payments are not included in the price.

Administrative price data come from a wide variety of sources. Many are collected directly from marketing boards, for example, the Ontario Wheat Producers Marketing Board and the Nova Scotia Grain Marketing Board; and market associations such as CANFAX. Some are collected and processed by provincial agricultural or statistical departments. Some data are generated from the regulatory activities of Agriculture and Agri-Food Canada and the Canadian Wheat Board.

Where administrative data are not available, prices are collected using the monthly Farm Product Prices Survey, which consists of a series of surveys. There are three farm surveys: the monthly farm Potato Prices Survey, the quarterly farm Ontario Tame Hay and Straw Prices Survey and the monthly Farm Product Prices Survey in Quebec. The reference date for the farm surveys is the

15th of each month and prices are collected by telephone during the five working days following the 15th.

There are two monthly company surveys: the Non-Board Grains and Speciality Crops Survey in the Prairies and the Grain Survey in the Maritimes. Administrative data, the Non-Board Grains and Specialty Crops Survey and the Maritime Grain Survey cover activity for the whole reference month; producing average weighted prices that reflect grades marketed.

There are some commodities within the farm cash receipts series that do not have prices; there are only values. These are generally smaller commodities such as maple, forest, individual floriculture and nursery products, and the other fruit and vegetable categories. The farm cash receipts for these unpriced items are used to establish the basket shares of these items, while their price movement comes from the aggregate index under which the item falls. For instance, the total vegetable index would be used to proxy the "other vegetable" category.

Data Accuracy

The methodology of the index and the price series which construct the index have been designed to control error and to reduce the potential effects of these. However, both administrative and survey data are subject to various kinds of errors. Survey data are mainly subject to response and data capture errors. In reporting prices each month, farm survey respondents are asked to report the average prices prevailing in their neighbourhood, taking into account the various grades of each commodity marketed. Thus, average prices reported by these respondents may differ from month to month due to changes in price, quality or both.

Every effort is made to ensure that administrative data are conceptually correct for the use to which they are put. Users should be aware that administrative data are generally compiled for an organization's own needs, and not for survey purposes. Any anomalies or inconsistencies detected are verified with the source, and where necessary, adjustments are made to reconcile data with the conceptual framework of our series. The administrative agencies used are considered to be the best sources available, and data received from them is judged to be of very good quality, even in those circumstances where adjustments have been made. Much price data come from the accounting departments of various marketing agencies, and are originally used to issue cheques to producers, are audited, and so quality is deemed to be excellent.

Comparability of Data and Related Sources

The current methodology (a chained index with monthly baskets) was applied to the index starting with 1992; there was no change in methodology for the indexes

before 1992. Although the index levels of the 1997=100 series will be different from those of the 1986=100 series, they will continue to show the same percent changes for the period ending in December 1991. The index prior to 1992 was constructed as a chain fixed-basket index.

Since the index is chained annually, measures of twelve-month price change are not measures of pure price change, as they would be in a direct seasonal-basket index, but are distorted by basket shifts.

However, since we calculate unlinked indexes for year y-1 and y based on the basket for years y-6 to y-2, we use this unlinked index to derive a measure of pure price change between any month m of year y-1 and the same month of year y.

The current index includes all farm cash receipts in the basket, whereas the previous index, prior to 1992, had been based upon products that account for about 95% of total farm cash receipts from farming operations. Commodities included in the index vary by province reflecting the regional agricultural production. For instance there are no special crop sub-indexes in the Maritime provinces.

Other Quality Indicators and Assessments

Statistics Canada had been using the 1980 Standard Industrial Classification system (SIC) for collecting, compiling and disseminating economic statistics on Canada's businesses. Beginning with the 1997 reference year, the North American Industry Classification System (NAICS) was introduced. It adds hatcheries and farms with only Christmas trees to the agricultural sector. The index base weights used for the commodities affected by NAICS were adjusted to reflect the new classification in 1997.

More detail on the quality of the data that are used to estimate the index, farm cash receipts and related data can be found in the following Statistics Canada publications.

DIRECT PROGRAM PAYMENTS TO PRODUCERS

Tables on direct program payments to producers are included in this publication from 1971 to date. Estimates are presented by program and by year at the provincial and national levels. **Except for the gross payments made for the major programs**, these data are not available on CANSIM.

Concepts

Direct program payments to producers represent the amounts paid under various **government** agricultural programs. Only those payments related to current agricultural production and paid directly to individuals involved in agricultural production are included.

These cover:

- subsidies to encourage production,
- subsidies to compensate producers for low market returns,
- payments to stabilize income,
- subsidies to reduce expenditures on farm inputs, and
- payments to compensate producers for crop or livestock losses caused by extreme climatic conditions, disease or other reasons.

Funding for the various agricultural programs under which direct payments are made is provided by the federal, provincial or municipal governments or is cost shared by various levels of government as well as producers themselves. In those instances where producers contribute to the funding of programs, the premiums associated with these programs are treated as an operating expense.

Payments made under private programs such as private hail and livestock insurance are not included in the direct program payments series. However, these private programs are accounted for in the Farm Cash Receipts series.

Direct program payments are reflected in the farm cash receipts and operating expenses series and, thus, in the net farm income estimates. The expenses series includes rebates or subsidies made to reduce input expenditures and, where applicable, the expenditures incurred by producers in the funding of programs. All other direct payments are included in the farm cash receipts series.

The direct program payments series does not attempt to cover all payments made to producers nor does it represent total government expenditures under all assistance programs.

The following type of payments are excluded:

- indirect payments,
- transfer payments, and

- capital grants.

Federal, provincial and municipal programs providing direct payments to producers represent one aspect of assistance. Indirect payments, which are more predominant in some provinces than in others, also provide assistance to producers.

Indirect payments to producers are provided under various programs. Payments are considered indirect when government funds are directed to a third party, outside the agriculture sector, for the benefit of producers. The boundaries of the sector extend to the first transaction point between agricultural producers and the purchasers of farm products. As well, the boundaries are limited on the input side by the first transaction point between agricultural producers and the suppliers of farm inputs. Most of the indirect payments either reduce producers' purchase costs of farm inputs or enhance returns from the sale of farm products. A wide variety of programs provide indirect payments, including those that reduce property taxes, transportation costs, fuel costs or interest costs as well as those directed at research, marketing or promotion.

Transfer payments are directed at individuals rather than at a specific industry. Payments such as training allowances are excluded from the direct program payments series because they are not directed at the agriculture industry but to individuals, regardless of their occupation.

A number of agricultural programs provide capital assistance grants. These grants are available directly to producers in order to improve or increase storage facilities or to assist in the purchase of equipment. Capital grants are excluded from the direct program payments series because they are not related to current production.

Users interested in information on federal government expenditure of all types on the agri-food sector can consult:

Farm Income, Financial Conditions and Government Assistance Data Book, Agriculture and Agri-Food Canada, Economic and Policy Analysis Directorate, Policy Branch. Also available on Internet (<http://www.agr.ca/policy/epad>).

Federal Agri-Food Expenditures 1982-1983 and 1983-1984, Monique Rodier, Agriculture and Agri-Food Canada, Development Policy Directorate, Working Paper, Ottawa, September 1985.

Federal Agri-Food Expenditures 1970-1971 to 1982-1983, Marcel Huot, Agriculture and Agri-Food Canada, Development Policy Directorate, Working Paper, Ottawa, December 1984.

Methods

The estimates of direct program payments to producers include all payments made directly to producers under federal, provincial and municipal programs. All payments data are obtained from administrative sources.

Direct program payments represent the amounts actually received by producers on a calendar year basis with the exception of the "Other payments" category, which includes some payments on a fiscal year basis. Although a program may be established in a given year, the payments to producers may be spread over two or more calendar years. In all cases, program payments are allocated to the year during which they are actually received by producers.

Estimates of net farm income encompass direct program payments either in the farm cash receipts or the farm operating expenses and depreciation charges series. Payments integrated in the cash receipts series include those under the Farm Income Protection Act (the Gross Revenue Insurance Plan and the Net Income Stabilization Account), the Crop Insurance Act, the Western Grain Stabilization Act, the Agricultural Stabilization Act, Tripartite Plans, Provincial Stabilization Programs, the Canadian Dairy Commission Act and those made under ad hoc government programs ("Other payments").

Note that private programs such as private hail insurance and private livestock insurance are included in the Farm Cash Receipts series under "Crop insurance payments" and "Other payments", respectively. In the Direct Program Payments section, the categories "Crop insurance payments" and "Other payments" include only government programs.

Direct program payments are shown explicitly in farm expenses. Where rebates apply, gross expense estimates are followed by rebates and then net expenses. Program premiums paid by producers are included in the "Stabilization premiums" category. Prior to 1971, rebates were deducted from expenses and only the net expenses were reported.

Data Comparability

There are no significant breaks in the direct program payments series which limit the comparability of the data over time.

Data Quality

As indicated above, the direct program payments series is estimated using administrative sources of data. Where necessary, data are adjusted to ensure conceptual consistency with the program payments series. The data obtained have been summarized from the financial transactions of individual producers. These summarized data are often subject to audit by independent

professional accountants and/or are used to make payments to individual producers. As a result, the quality of these data is considered to be very good. However, the data are subject to the general non-sampling errors present in all types of administrative data.

Data Revisions

Annual direct program payments data are published twice each year, at the end of May and at the end of November. In May, payments for the previous two calendar years are subject to revision. In November, payments for the previous three years may be revised. Every five years a historical revision is done based on the results of the Census of Agriculture. The results of the latest intercensal revision, based on the 1996 Census of Agriculture, have been included with the June 1999 supplement, and apply to the period 1986 to 1998.

Due to the nature of the data used in the program payments series, revisions have not been frequent and, when they have occurred, they have usually been quite small.

CANADIAN FARM BALANCE SHEETS

The Canadian farm balance sheets have been designed to: record the value of farm business assets; record the value of farm business liabilities; record the value of equity for farm businesses; display standard financial ratios which are based on estimates from the balance sheet and the value added account; be based on the establishment concept; display the information as at December 31, by province, from 1981 to date.

Four different balance sheet accounts have been developed in order to separate the assets and liabilities of farm businesses from those of farm operator households and non-operator landlords. Non-operator landlords are individuals or businesses not engaged in the activity of farming who lease assets to farm operators.

For the purpose of the balance sheet accounts, it is assumed that non-operator landlords lease only farm real estate assets to farm operators.

In this publication, data are provided only for the Balance Sheet of the Agricultural Sector (set 2). This is because set 2 most closely reflects the assets employed in the production of agricultural products. The other sets of balance sheet accounts are available on request. The four sets of aggregate balance sheets produced for Canadian agriculture are as follows:

Set 1 - The Balance Sheet of the Agricultural Sector and Farm Operator Households includes all farm sector assets and liabilities regardless of ownership. It treats the farm operator households and farm businesses as a single entity. It also includes farm real estate assets leased from non-operator landlords and the liabilities outstanding on these assets.

Set 2 - The Balance Sheet of the Agricultural Sector is designed to account for only those farm assets and liabilities used in the production of agricultural products. This set includes farm real estate assets leased from non-operator landlords and the liabilities outstanding on these assets. It treats the farm operator households and farm businesses as separate entities, so the personal portion of farm households' assets and liabilities is excluded.

Set 3 - The Balance Sheet of Farm Businesses and Farm Operator Households reflects the position of farm operators and includes the assets and liabilities of both farm businesses and farm operator households. Thus the value of farm real estate leased to farm operators by non-operator landlords is not part of this balance sheet. Similarly, the liabilities related to these leased assets are excluded.

Set 4 - The Balance Sheet of Farm Businesses of Farm Operators includes only the farm business portion of assets and liabilities. This account excludes the assets and liabilities of both non-operator landlords and farm operator households.

The layout of the balance sheet follows that recommended in the Farm Accounting Standardization Manual, published by the Farm Accounting Standardization Review Committee, Farm Credit Corporation, 1991. Some definitions and comments on the concepts and ratios have also been extracted from this manual.

Although ratio analysis can assist in managing and analyzing a business, a proper financial analysis of the business requires more tools than just ratio analysis. Consequently, complete reliance upon such financial measures is a very unsound business practice. The four major types of financial ratios which have been calculated include: liquidity, solvency, profitability, and financial efficiency.

The ratios calculated in the tables reflect an aggregate ratio for the agricultural sector. Users should note that the desired and actual value of the ratios will vary significantly according to the type of farming activity (livestock, crop, horticulture, etc.).

When developing and interpreting financial ratios, many limitations must be kept in mind, such as the method of asset valuation; the type, size, and cycle of the business; and the information used to prepare it. Ratios are most meaningful when compared between years. For further information on developing and interpreting financial ratios, refer to the Farm Accounting Standardization Manual.

Users should be especially cautious in using estimates of accounts receivable and cash, bonds and savings data in the provinces of Manitoba, Saskatchewan, Alberta and British Columbia. The estimates of cash, bonds and savings in these provinces may include the value of deferred grain receipts whereas these receipts are generally reported under "accounts receivable". This should not affect the aggregate estimates of current assets.

Concepts

Current assets are assets which in the normal course of operations are expected to be converted into cash or consumed in the production process within one year. The three components include: cash, bonds and savings; accounts receivable; and inventories.

Accounts receivable are amounts owed to farm businesses, usually arising from the sale of goods or services. Examples include uncollected receipts for grain or livestock sales, or custom work performed.

Inventories are items of tangible property which are held for sale in the ordinary course of business, or are in the process of production for such sale, or are to be directly consumed in the production of goods or services. The three categories of inventories are: poultry and market livestock; crops; and inputs.

Poultry and market livestock include chickens, turkeys, slaughter beef heifers, steers, calves, pigs other than boars or sows, and market lambs.

Crops include wheat excluding durum, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, tobacco, and potatoes.

Inputs include feed, seed, fertilizer, chemicals, fuel, and other supplies used for farm businesses.

Household contents include assets such as furniture and appliances. The farm business portion of household contents refers to office fixtures, equipment and supplies.

Quota is essentially a license, or a right, to sell a certain amount of a specific commodity. This right is regulated by marketing boards. Some quotas (such as milk) are transferable and therefore have a value associated with them. In provinces where quotas are traded, quota values reflect current market values. In provinces where quota trading is prohibited, quota values are implicitly reflected in the value of fixed assets of agricultural holdings because some of the value of quota is normally capitalized into fixed assets.

Breeding livestock consists of animals acquired or raised for the production of progeny, or for the production of a livestock product. Breeding livestock includes bulls, dairy cows, beef cows, dairy heifers, beef replacement heifers, boars, sows, rams, ewes and replacement lambs. Also included are all animals on fur farms at December 31 because all or the great majority of these are breeding stock.

There are three components of **machinery**: autos, trucks and other machinery. Other machinery includes equipment for tillage, planting, fertilizing, chemical application, harvesting and haying; dairy, poultry, and other livestock equipment; and other miscellaneous items.

Farm real estate includes land, service buildings and homes (owned and leased). The value of land includes all farm land operated by farm operators. The value of service buildings includes all buildings except homes. The value of homes includes all farm dwellings occupied by farm operators.

Total assets includes all tangible and intangible items of value at December 31. It is the sum of current assets, household contents, quota, breeding livestock, machinery, and farm real estate.

Current liabilities are payable within the current year. Examples include accounts and notes payable within the year.

Long-term liabilities have a maturity beyond one year from the date of the balance sheet. Examples include mortgages and equipment loans owed by farm operators to various lenders. These lenders include: chartered

banks; the Farm Credit Corporation; the Farm Business Development Bank; credit unions; treasury branches; Veterans Affairs; federal and provincial agencies; insurance, trust and loan companies; supply companies; and private individuals.

Total liabilities include all obligations of a business arising from past transactions that are to be paid in the future. Total liabilities is the sum of current and long-term liabilities.

Equity refers to the ownership interest in the business. Equity equals total assets minus total liabilities and could be considered to be the owners' claim against the assets of the business. Equity is increased by the owners' net contribution of assets to the business and the accumulated net income of the business. As equity is derived residually, by definition any change in the value of assets and liabilities will cause a proportionately larger change in the value of equity. However, equity is not as sensitive to a change in its components as is the net income estimate (page 18). This is because liabilities are quite small compared to assets, whereas expenses are large when compared to receipts.

Liquidity refers to the ability of a business to meet financial obligations as they come due in the ordinary course of business. Three liquidity ratios are calculated using balance sheet values: the current ratio, the acid-test or quick ratio and the debt structure ratio.

The **current ratio** measures a business' ability to meet financial obligations as they come due, without disrupting normal operations. If the current ratio is greater than 1, the business is considered to be liquid. A ratio of less than 1 may indicate a potential liquidity problem. Users should note that a favourable liquidity position may be a misleading indicator of the ability of current assets to cover current liabilities because a significant portion of the current assets may be comprised of inventories which may not be easily converted to cash. Also, the value of the ratio may vary depending upon the production cycle, (eg. the ratio may obtain a significantly different result if calculated in the fall when inventories are typically high than in spring when inventories are usually depleted). The ratio is also limited in that it does not predict the timing or the adequacy of future cash flows.

The **acid-test (quick) ratio** is a variation of the current ratio, and is defined as the ratio of cash, marketable securities, and accounts receivable to current liabilities. The exclusion of inventories in the calculation allows for an assessment of the "immediate" liquidity position of farm businesses. An acid-test ratio of 1 indicates that there are just enough assets of a very liquid nature to cover current liabilities. The desired value of the ratio varies according to type of farming activity. For example, the desired value of the ratio for a dairy operation will be different than for a grain operation. The ratio is also limited in that it does not predict the timing or the adequacy of future cash flows.

The **debt structure ratio** measures the proportion of current liabilities to total liabilities. This ratio, in conjunction with the current ratio, will provide information on the relative solvency of a business. A high debt structure ratio may indicate solvency problems. However, this may not always be the case, especially for farm businesses with a relatively low value of long-term liabilities. In this case, businesses may have no solvency problems. Thus it is important to interpret this ratio in conjunction with the value of liabilities and cash flow from farming operations.

Solvency refers to the financial measures that gauge the amount of debt of a business relative to the amount of capital invested in the business. Three solvency ratios are calculated using values from the balance sheet: leverage, equity, and debt. These ratios are indicators of the risk involved in investing in the operation: the higher the debt, the greater the risk to all investors.

The **leverage ratio** is the value of total liabilities per dollar of equity. The ratio is a measure of the degree to which the creditors have financed the business as compared to the owners. The higher the ratio, the greater the financing of the farm business by creditors. A leverage ratio of 0.5, for example, indicates that the farm operators have twice as much equity as debt. The higher the value of the leverage ratio, the greater the creditors have financed the farm businesses and thus the higher the risk. The desired value of the ratio will depend upon the income variability of farm businesses and other factors such as the risk associated with production, farm businesses with high income variability or business risk would desire a lower ratio.

The **equity ratio** is the value of equity per dollar of total assets. The ratio measures the proportion of total assets financed by the owners, as opposed to that financed by creditors. The higher the ratio the more resources are supplied by the owners.

The **debt ratio**, is a measure of the extent of leverage being used by a business, or the proportion of total assets financed by debt. The higher the ratio, the higher the financial risk.

Profitability refers to the extent to which a business is able to generate profit from the utilization of the business resources. Profitability ratios are calculated using values from the balance sheet and the value added account because the two series are conceptually and methodologically related. The three calculated profitability ratios are: capital turnover, return on assets and return on equity.

The **capital turnover ratio** indicates the extent to which a business efficiently utilizes its assets to generate revenue. The higher the ratio the more efficiently assets are being used to generate revenue. The desired value of the capital turnover ratio will vary significantly by type of farming activity. Users should be aware that the ratio

is a comparison of flows over stocks, that is, revenues cover an accounting period while total assets refer to a specific point in time. Therefore the ratio may be misleading in the event that total assets fluctuate significantly in one direction (either up or down) in the accounting period.

The **return on assets ratio** is a measure of return on investment, it reflects earnings per dollar of both owned and borrowed capital. The higher the ratio the greater the return on assets.

The **return on equity ratio** provides a measure of the return to the owner on the owner's investment in the business, as it reflects only the return per dollar of owned capital.

Because the value of unpaid family and operator labour is not estimated, the usefulness and the interpretation of return on assets and return on equity may be influenced. Comparisons of these ratios to other return on assets and return on equity ratios should not be made unless the method of calculating the ratios is the same. These ratios do not consider the unrealized capital gains that may be present in the value of assets such as farm land. The higher the value of return on equity the greater the return on investment. However, a high value for this ratio may signify a highly leveraged business, therefore interpretation of the significance of this ratio should be made in conjunction with other ratios.

The return on assets ratio and the return on equity ratio reflect the different balance sheets. In sets 1 and 2, which include non-operator landlords, the returns include rent to non-operator landlords. In sets 1 and 3, which include the personal share of households, the returns include the family wages.

Financial efficiency refers to the extent to which a business is able to efficiently utilize the businesses resources.

The **interest coverage ratio** is one of the most widely used financial efficiency ratios for analyzing the ability of a business to pay the interest on debt. Similar to the return on assets or equity ratios, the interest coverage ratio reflects the inclusion or exclusion of non-operator landlords and the personal share of households.

Methods and Data Quality

The balance sheets are derived, for the most part, using data already produced by the Agriculture Division. Values for most assets are derived from the capital value and depreciation series of the Agriculture Economic Statistics (AES). Since the capital value series uses a reference data of July 1 while the balance sheets use December 31, estimates for the two series are not the same. Also, the capital value series includes the personal share of assets while the balance sheet (set two) excludes it.

Although not published in the capital value series, the components of farm real estate, machinery and livestock are available as a result of the estimation process used to derive the capital value and depreciation series. The business share of homes, autos and trucks are estimated using the same assumptions used in the depreciation series (page 29).

The value of assets obtained from the capital value and depreciation series represents roughly 84% of the total value of assets in the balance sheet. These estimates are considered to be of good quality. Further data quality is available by referring to the sections on the capital value and depreciation series (pages 34 and 29).

The value of household contents, although based on assumptions (described below) considered to be only passable, represents only 1% of the value of total assets.

The year-end value of crops, obtained from the Prices Unit, represents roughly 3% of the total values of assets, and is considered to be of good quality.

The other four components of assets (cash, bonds and savings; accounts receivable; inputs; and quota) represent roughly 12% of the value of total assets. They are derived using Farm Credit Corporation (FCC) survey data for the years 1980, 1983, 1987, 1989 and 1991 and the Farm Financial Survey (FFS) since 1993. In intervening years, interpolations are made.

Total liabilities are derived from the debt outstanding series of the AES. Total debt outstanding is split between current and long-term liabilities using ratios derived from the FCC or FFS survey data. These sources are considered to be of good quality.

The personal share of long-term debt is excluded using the ratio of farm real estate excluding the personal share to farm real estate including it. It is assumed that none of the current liabilities are for personal use. These assumptions are considered reasonable.

Estimates of the balance sheet components are calculated for each province and year. Canada level estimates are derived by summing provincial estimates. Annual financial ratios are calculated separately for each province and Canada.

As the balance sheets are essentially an integrated account, incorporating data from other series in this publication, the revision process is determined by the various source series (farm debt outstanding, farm capital value, and the value added account). For a better understanding of this process, users should refer to the appropriate section of the concepts and methods of these series.

Current assets are the sum of cash, bonds, and savings; accounts receivable; and inventories.

Cash, bonds, and savings estimates for sets 1 and 3 are based on FCC or FFS survey data. For sets 2 and 4, adjustments are made to exclude the personal share of farm household cash, bonds and savings. It is assumed that two-thirds of the total cash, bonds, and savings relate to the personal share of farm households. This assumption is based on U.S. farm balance sheet data. Thus, two-thirds of the estimate is deducted to exclude the personal share of farm households.

Accounts receivable estimates are based on FCC or FFS survey data. There is no adjustment between sets.

Inventory estimates are based on several sources including the Eggs and Poultry Survey and the January Farm Survey (for further documentation concerning concepts, data reliability, limitations or the methodology of these surveys, consult *Livestock Statistics*, Statistics Canada Catalogue No. 23-603-XPE). There are three components of inventories: poultry and market livestock; crops; and inputs. All of the value of inventories is assumed to pertain to farm businesses. Estimates for sets 2, 3 and 4 are the same as those for set 1.

The year-end value of **poultry and market livestock** is the sum of year-end values for poultry plus market livestock. These are derived by multiplying inventory figures by value per head data (from administrative sources). Market livestock include beef slaughter heifers, steers, calves, pigs other than boars or sows, and market lambs. The value of fur animals intended for pelting is not calculated separately as most fur animals are pelted in the fall.

The value of **crops** is derived by adding year-end values for wheat excluding durum, durum wheat, oats, barley, rye, corn, flaxseed, canola, soybeans, tobacco, and potatoes. These year-end values are derived by multiplying averages of December and January prices by year-end stocks estimates.

Estimates of the value of **inputs** are based on FCC or FFS survey data.

The value of **household contents** is derived from the value of homes. Household contents is assumed to be 60% of the value of homes. This assumption is based on the structure of home insurance policy packages where coverage on contents is generally insured at 60% of the dwelling value. For each set, the value of household contents is calculated to be 60% of the corresponding value of homes. As described later, the value of homes estimate varies from set to set as adjustments are made to exclude the personal share and the portion leased from non-operator landlords.

Quota estimates for all sets are based on FCC or FFS survey data.

For all sets the year-end value of **breeding livestock** is the sum of year-end values for bulls, dairy cows, beef

cows, dairy heifers, beef replacement heifers, boars, sows, rams, ewes, replacement lambs and breeding stock on fur farms. These are derived by multiplying inventory values by value per head data (from administrative sources). The value of animals on fur farms is derived by multiplying the number of animals on farms at year end by a value per head which is based on changes in pelt prices. Data for animals on fur farms are obtained from the Livestock Section of Agriculture Division and may include some animals which were not pelted during the normal fall pelting season.

There are three components of **machinery**: autos, trucks and other machinery.

Auto and **truck** estimates for sets 1 and 3, as well as **other machinery** estimates for all sets, are derived from Agriculture Division's capital value series (included in this publication). July 1 values are averaged to estimate year-end values. For the most current year, the July 1 value is used as a proxy for the year-end value. **Auto** and **truck** estimates for sets 2 and 4 exclude the personal share of farm operator households.

There are three components of **farm real estate**: land, service buildings and homes. Estimates of these values for set 1 are derived from Agriculture Division's capital value of land and buildings series. July 1 values are averaged to estimate year-end values. For the most current year, the July 1 value is used as a proxy for the year-end value.

For set 2, the values of land and service buildings are the same as those in set 1. The farm business portion of homes is derived by multiplying the value of homes in set 1 by 15%. It is assumed that 15% of the farm operator's home is used for farm business purposes. This approach is consistent with that used in related series.

For set 3, the value of farm real estate owned by non-operator landlords is excluded by multiplying estimates of land, service buildings and homes from set 1 by annual provincial ratios. These ratios are based on land tenure data from the FCC or FFS surveys.

For set 4, both the personal household share of the value of homes and the value of real estate leased from non-operator landlords need to be excluded. Estimates of the value of land and service buildings are the same as those for set 3, but the value of homes from set 3 is multiplied by 15% to obtain the business share.

Total assets are the sum of current assets, household contents, quota, breeding livestock, machinery and farm real estate.

Current liabilities are based on Agriculture Division's total debt outstanding series. Estimates of total debt outstanding for each province are multiplied by ratios of current debt to total debt which are derived from FCC or FFS survey data. No adjustments are made.

For set 1, **long-term liabilities** are calculated as total debt outstanding less current liabilities. Long-term liabilities are then adjusted to exclude the portions for non-operator landlords and farm operator households.

For set 2, the value of long-term liabilities excluding the farm household is calculated by multiplying estimates of long-term liabilities from set 1 by the ratio of the total value of farm real estate excluding households from set 2 to the total value of farm real estate including households from set 1.

For set 3, estimates of long-term liabilities for non-operator landlords are deducted from estimates of long-term liabilities from set 1. Estimates of long-term liabilities for non-operator landlords are calculated in the following manner: the sum of Agriculture Division's estimates of mortgage debt held at chartered banks; at the Federal Business Development Bank (FBDB); at credit unions; under the Veterans Land Act; and by insurance, trust and loan companies is multiplied by the proportion of total agricultural land held by non-operator landlords as determined from FCC or FFS land tenure data. Two assumptions are made: 1) only the aforementioned agencies lend to non-operator landlords; and 2) non-operator landlords mortgage the same proportion of the value of their farm real estate as farm operators.

For set 4, the non-operator landlord's share and the personal household share of long-term liabilities are both excluded. Values of long-term liabilities from set 3 (which exclude the non-operator landlord's share) are multiplied by the ratio of the total value of farm real estate excluding the farm household from set 4 to the total value of farm real estate including the farm households from set 3.

Total liabilities are the sum of current and long term liabilities.

Equity equals total assets less total liabilities.

The balance sheet is used to derive all of the **liquidity** and **solvency ratios**.

For the **profitability** and **efficiency ratios**, the balance sheet and the value added account are both used to calculate ratios.

The **current ratio** (CA/CL) is calculated as current assets (CA) divided by current liabilities (CL).

The **acid-test (quick) ratio** $[(C+AR)/CL]$ is cash and marketable securities plus accounts receivable, divided by current liabilities. To calculate this ratio, the value of cash, bonds and savings (C) is used as a proxy for cash plus marketable securities. The acid-test ratio is calculated as cash, bonds and savings (C) plus accounts receivable (AR), divided by current liabilities (CL).

The **debt structure ratio** (CL/TL) is the current liabilities (CL) divided by total liabilities (TL).

The **leverage ratio** (TL/E) is calculated as total liabilities (TL) divided by equity (E).

The **equity ratio** (E/TA) equals equity (E) divided by total assets (TA).

The **debt ratio** (TL/TA) is calculated as total liabilities (TL) divided by total assets (TA).

The **capital turnover ratio** (R/TA) is calculated as revenue divided by total assets. For our purposes, revenue (R) is derived from the value added account by summing: sales of agricultural products, sales of non-agricultural products, and other sources of the value of production. The value used for total assets (TA) is the value of total assets at the **beginning** of the period in which revenues were earned (i.e. the value of total assets as at December 31 of the previous year).

Return on assets equals net income before taxes (NIBT) plus interest (I) expense divided by average total assets (ATA). For set 1, net income before taxes plus interest expense is derived from the value added series by adding rent to non-operators, corporate profits, wages to family, unincorporated operator returns and interest. For sets 2 and 4, wages to family is not included. Rent to non-operators is not included for sets 3 and 4. Average total assets (ATA) is calculated as the average of total assets at the beginning and end of the year. Thus, return on assets is calculated as $[(NIBT+I)/ATA]$.

Return on equity consists of net income divided by average equity. Because of the difficulty involved in separating the value of income taxes attributable to farm income from that attributable to non-farm income, income tax expense cannot be estimated for the agricultural sector. Thus, net income after taxes cannot be estimated for the agricultural sector, so net income before taxes (NIBT) is used as a proxy for net income. For set 1, net income before taxes is derived from the value added series by adding corporate profits, wages to family, and unincorporated operator returns. For sets 2 and 4, wages to family is not included. Average equity (AE) is calculated as the average of equity at the beginning and end of the year. Thus, return on equity is calculated as $(NIBT/AE)$.

The **interest coverage ratio** $[(NIBT+I)/I]$ is defined as net income before taxes plus interest expense, divided by interest expense. The method for deriving the numerator (NIBT+I) is described in the earlier paragraph on the return on assets. The denominator (interest expense) is also from the value added accounts.

VALUE ADDED ACCOUNT

Concepts

The value added account (or production account) has been designed to: record the value of economic production in the Canadian agricultural sector; distribute the income earned in this production to the factors of production; be based on the establishment concept; and display the information on a calendar year basis, by province, from 1981 to date. These data are available on the CANSIM database.

Economic production can be defined as any process which creates value or adds value to existing goods. Consistent with this definition, the Canadian System of National Accounts defines economic production as the production of goods or services which are exchanged for money in the market economy.

Under the establishment concept, the standard unit of aggregation is the establishment. This is defined as the smallest operating entity which produces a homogeneous set of goods and services for which records provide data on value of output and cost of inputs.

The format of the value added account is designed to display sources and allocation of income (value of production). This account displays information at an aggregate level and does not display the detail which is available in the net farm income series.

The sources of income fall into four major categories: sales of agricultural products, sales of secondary production, other sources, and own-account production uses.

Sources of value of production

All **sales of agricultural products** are included in the value added account, including sales to other sectors and sales within the sector (farm to farm sales). Sales to farms outside the province of production are considered as sales to other sectors, as the objective is to produce provincial level accounts.

The use of the establishment concept implies that all **secondary production activities** of farm establishments should be included in the value added account. These might include farm woodlot production, sales of sand and gravel, or provision of recreational services. The income from all secondary production activities should be matched with associated expenses.

Other sources of income and the associated expenses are included to account for all income earned by farm establishments. The distinction between a non-agricultural sale and other income is not always clear. Federal and provincial government payments, received by farm establishments for participation in a variety of support and stabilization programs, are included because

they are directly associated with farming activity. Income from the rental of farm land, received by the farming establishment, and custom work receipts are also included here.

Own-account production includes income-in-kind and the value of inventory change. Income-in-kind is the measure of the value of products produced on a farm which were consumed on the farm where the production occurred, instead of being sold. Production from farm gardens kept solely for own-consumption purposes is interpreted as operator household activity and is therefore excluded. The value of inventory change represents the economic value of the physical change in farm-owned inventories. Own-account production excludes the use of agricultural products, which are produced on the same establishment and used to produce other agricultural products for the market place.

The sum of these four sources of income results in the total value of production or the gross output of the agricultural sector.

Allocation of value of production

The allocation of that income falls into four major categories: expenses on inputs, business taxes, depreciation, and net value added.

Expenses on inputs include payments for goods and services which are used in the production of agricultural goods or services. These purchases may have been made from other sectors of the economy or other agricultural establishments. These intermediate inputs exclude, by definition, primary inputs such as labour and capital. Inter-farm sales, which are included as a source of income, are therefore offset by inter-farm purchases.

Business taxes are taxes paid in the course of production activities. These taxes consist of property taxes and taxes on purchased inputs. Since taxes on purchased inputs are included in expenses on inputs, business taxes consist of property taxes only.

Gross value added consists of payments to the factors of production and **depreciation** allowances (on an economic basis).

Net value added represents the value of economic production from agricultural establishments, and is expressed as gross value added minus **depreciation** allowances.

Distribution of net value added

Net value added is then distributed to the various factors of production, including wages to non-family members; rent to non-operator landlords; and interest to lenders of capital.

Corporation profits, a return for ownership, can be

allocated to incorporated agricultural businesses. For unincorporated farms it is impossible to distinguish between labour and profit. Consequently, the unincorporated operator family returns represent returns to operators and immediate families for labour and ownership. Further, wages to family members are distributed to result in returns to the unincorporated farm operators for unpaid labour and equity capital.

Methods and Data Quality

The method used to derive value added account estimates is based, whenever possible, on estimates which are used in the calculation of net income, including the farm cash receipts and farm operating expense series. Consequently, this outline is designed to be used with methodology reviews of the net income based data (page 18).

Data on sales of agricultural products to other farms and expenses on inputs from other farms are the sum of the following differences: total feed minus commercial feed; total seed minus commercial seed; and total livestock and poultry purchases minus interprovincial and international imports. Data related to total feed and seed expense are considered to be of good quality but the portions allocated to commercial feed and seed are weak. Data on livestock and poultry purchases are also weak, given problems identified with these estimates (i.e., the lack of good data to measure interprovincial movements).

Sales of secondary production are underestimated as it only includes the value of forest products sold. It is impossible to quantify this underestimation or its impact on the value of production, since there is no known source of information on the value of non-agricultural activities performed on farms, such as recreational activities and exploitation of gravel and sand pits.

The adjustments made to split farm land rental income between operator owners and non-operator landlords are based on the biennial Farm Financial Survey (FFS) information which is considered to be of good quality.

The adjustments made to split total wages into family and non-family wages, based on Census of Agriculture and FFS information, are considered to be of good quality.

Once revisions are made to the cash receipts and the expense series, they are then incorporated into the value added account. These revisions take place intercensally, after the results of the Census of Agriculture have been reviewed, and during non-intercensal periods, when more administrative data or larger Taxation Data Program (TDP) survey samples are available. Please refer to the concepts and methods of these contributing series for more detail on the revision process (pages 19 and 26).

Sources of value production

Sales of agricultural products to other farms represent the inter-farm sales of the following three items: livestock and poultry, feed, and seed.

Livestock and poultry inter-farm sales are based on TDP data. The TDP data represent total purchases on the part of producers. The data are adjusted by subtracting imports from other provinces and from outside Canada.

Inter-farm sales of feed are derived by subtracting estimates of commercial feed (expense series) from total feed expenses.

Inter-farm sales of seed are derived by subtracting estimates of commercial seed (expense series) from total seed expenses.

Sales of agricultural products to other sectors represent total crop and livestock receipts, excluding cash receipts from sales of forest products (cash receipts series).

Sales of secondary production currently include only sales of forest products (cash receipts series).

TDP estimates are used to measure **custom work receipts**.

Program payments data are based on estimates from the cash receipts series.

Government rebates data are based on estimates of rebates reducing expenses from the expense series.

Farm land rent represents total rental income to operators for the rental of agriculture land and buildings. It is based on the expense series estimates for cash rent and adjusted to exclude rent paid to non-operators, using survey data related to the quantity of farmland rented to others. The survey data is obtained biennially from the FFS.

Income-in-kind data are based on estimates from the net farm income series.

The **value of inventory change** represents the value of the physical change in inventories as calculated for net income purposes.

Total value of production is the sum of all sources of income.

Allocation of value of production

Expenses on inputs from other farms (purchases) combine the estimated sales of agricultural products to other farms with the farm land rent.

Expenses on inputs from other sectors is the sum of

several expense estimates calculated for the farm operating expense series (gross of rebates). These are: building and fence repairs, electricity, telephone, heating fuel, machinery fuel and repairs, fertilizer and lime, pesticides, commercial seed, irrigation, twine, wire and containers, crop and hail insurance, commercial feed, livestock and poultry purchases, artificial insemination and veterinary fees, business insurance, stabilization premiums, legal and accounting fees, and other expenses. Also included is custom work expense based on TDP estimates (gross expense).

Business taxes currently include only property tax estimates from the expense series.

Gross value added is derived by subtracting expenses on inputs and business taxes from the total value of production.

Depreciation data are based on estimates from the expense series.

Net value added is calculated by subtracting depreciation from gross value added.

Distribution of net value added

The labour compensation is an estimate of **non-family wages** and is derived by deducting family wages (see below) from total wages (expense series). Non-family wages include room and board.

Rent to non-operators is calculated by applying a ratio obtained from FFS data to the sum of cash and share rent estimates (expense series).

Interest data are based on estimates from the expense series.

Corporation profits are estimated at the provincial level by the Income and Expenditure Accounts Division, Statistics Canada. These profits are before taxes.

Unincorporated operator family returns are derived residually by subtracting non-family wages, rent to non-operators, interests and corporation profits from net value added.

Family wages are derived by subtracting room and board and non-family wages from total wages. Ratios of non-family wages to total wages are obtained from the Census of Agriculture and from the biennial FFS. Room and board are excluded since they are added to non-family wages.

Unincorporated operator returns are derived residually by subtracting family wages from unincorporated operator family returns.

FARM BUSINESS CASH FLOW STATEMENT

Concepts

The cash flow accounts, which are presented here for 1981 to date, are part of an integrated set of accounts for agriculture. They are third in a series which includes the value added account and the balance sheets. Both of these accounts provide data for the cash flows; therefore, the concepts and methods from those series should also be reviewed in conjunction with the following information.

The cash flow accounts are summaries of cash flows in and out of farm businesses over a calendar year. The basic function of the accounts is to provide information on the financial position of farm establishments (i.e., the amount of cash available to farm establishments to meet current obligations). Specifically, only cash flows pertaining to farm operators are included. Therefore, cash income and expenses of non-operator landlords and the personal portion of households are excluded.

In theory, the establishment concept is used as a basis for the cash flows. An establishment is defined as the smallest operating entity which produces a homogeneous set of goods and services for which records provide data on value of output and cost of inputs. However, in practice this theory is not strictly adhered to, as seen in the following methods.

The accounts are formatted as follows: cash transactions from agricultural production, which account for internal sources (i.e., production activities of the farm business) and uses of funds; cash flows from non-production activities consisting of changes in levels of farm loans outstanding and net capital purchases; and ratios which indicate how internal and external sources of cash affect current and future farm operations.

It is important to keep in mind that all measures in the accounts are strictly cash exchanges.

Cash Transactions

There are five main components of **cash sources**: sales of primary production; sales of secondary production; program payments; government rebates; and other cash income.

Sales of primary production consist of principal production activities of farm businesses and include crop and livestock receipts. Under the establishment concept, **sales of secondary production** are also recorded. Farm woodlot sales are the only secondary production added as sources of cash. Other sales of non-agricultural products and services generated by the farm assets, such as recreational services, or sand and gravel, could have also been added if such information was available.

Program payments and **government rebates** are

included as cash sources because they are directly associated with farm production. Cash income that is a result of activities not directly related to agricultural production is included as **other cash income**. Included in this category are: agricultural custom work receipts and interest income and dividends earned by farm business assets. The latter consists of farm cooperative dividends and interest that applies only to the farm business. All personal savings of operators and households are excluded.

Cash uses include the following: expenses on inputs, business taxes, interest, cash wages to hired labour and cash rent to non-operators.

The above items consist of payments and services necessary for the production of agricultural goods and services. These expenses are meant to capture all cash that leaves the agriculture sector. For example, cash paid to non-operator landlords and non-family hired labour is deducted from cash income because it is no longer available to the farm business.

Cash income consists of cash sources less cash uses.

Cash Flows

The **net change in loans outstanding** is an additional source of cash that is external to the production activities of the farm business. An increase in the total value of loans is a positive source of cash income and a decrease is a negative source (or a use) of cash income. The purpose of displaying both current and long-term debt is to identify the relationship between short-term borrowing and cash income. For example, it could be argued that short-term borrowing is affected to a large degree by fluctuations in cash income. In contrast, long-term loans are less likely to be influenced by year-to-year changes in cash income because they relate to long-term investment.

Cash income (sources minus uses), plus the net change in loans outstanding is the amount of **cash available to farm businesses for capital and/or financial investments or withdrawal**. Note that while total net income and gross value added are measures of economic production, cash for investment or withdrawal is strictly a cash measure. Thus changes in values of inventories and income-in-kind are not included in the cash flow accounts.

Net capital purchases represents the flow of cash from real estate and non-real estate purchases and sales associated with the farm business. Personal investments (household purchases for example) are excluded. When a farm business is sold, the income received by the retiring operator is not included as cash income, since the operator has left the farm business sector.

Cash flow available for financial investments or withdrawal is the amount that is available for proprietors

and shareholders to meet current obligations. This figure indicates how much cash is available to the farm business after all farm transactions and capital investments have taken place.

RATIOS

Ratios of current and long-term liabilities to cash uses indicate the amount of debt that is used to finance cash uses. If the ratio is high and positive, the farm business is accumulating more debt while paying for farm inputs.

Ratios of net change in loans outstanding to capital purchases reflect the importance of external financing for capital investments.

Ratios of loans outstanding to cash income indicate the burden of farm debt on farm cash income. Comparing this ratio between years illustrates whether farm businesses are spending more or less of their cash income to reduce their debt outstanding.

Methods and Data Quality

The method used to derive cash flow estimates is based, whenever possible, on estimates which are used in the calculation of net income, including the farm cash receipts and farm expense series. Consequently, this outline is designed to be used with methodology reviews of the net income-based data. For further information on data quality refer to the Concepts and Methods for the balance sheet (page 43) and the value added account (page 49).

CASH TRANSACTIONS

Cash Sources

Sales of primary production include total crop and livestock receipts, based on farm cash receipts estimates for net income purposes. Excluded are cash receipts of forest products and share rent income to non-operators.

Sales of secondary production include sales of forest products and are based on farm cash receipts estimates.

Program payments are based on farm cash receipts estimates.

Government rebates are based on farm operating expenses estimates of rebates reducing expenses.

Other cash income includes custom work receipts as well as dividends and interest.

The National Farm Survey (NFS) was used to measure **custom work receipts** prior to 1991. Taxation Data Program (TDP) estimates were used for this measure from 1991 to date.

Dividends and interest relate to farm business investment income only. Interest earned on personal savings accounts is excluded. Estimates are derived using Bank of Canada deposit rates for non-verifiable savings deposits. These rates are multiplied by the value of cash, bonds, and savings from the balance sheets. Non-operator landlords and the personal portion of farm households are excluded (Balance Sheet - Set #4).

Cash Uses

Expenses on inputs, based on farm operating expense series, include: building and fence repairs, electricity, telephone, heating fuel, machinery fuel and repairs, fertilizer and lime, pesticides, commercial seed, irrigation, twine, wire and containers, crop and hail insurance, commercial feed; livestock and poultry purchases, artificial insemination and veterinary fees, business insurance, stabilization premiums, legal and accounting fees, and all other expenses. Also included is custom work expense based on TDP estimates (gross expense).

Business taxes currently include only property taxes and are based on expense series estimates.

Interest data are based on expense series estimates.

Cash wages to hired labour include only wages and salaries paid to non-family members. This is derived by subtracting family wages from total cash wages from the expense series. The family wage ratio used is based on data from the biennial FFS and is benchmarked to the Census of Agriculture every five years. Room and board is not included since this is not a cash transaction.

Cash rent to non-operators is calculated by applying a ratio obtained from FFS data to cash rent estimates from the expense series.

Cash Flows

Cash income equals sources minus uses.

Net change in loans outstanding is based on estimates used in the Balance Sheet - Set #4 (excludes non-operators and personal portion of farm households). Debt outstanding for the current year is subtracted from the previous year's debt outstanding.

Cash for investment or withdrawal is derived by adding the net change in loans outstanding to cash income.

Figures for **real estate purchases and sales** were obtained from the Farm Credit Corporation survey in 1983 and every two years since 1987 from the Farm Financial Survey. **Non-real estate purchases** include land improvements, housing construction (15% of this value is assumed to relate to the farm business), other construction, and farm machinery (includes cars, trucks, combines, tractors, and irrigation equipment). Note that farm machinery purchases include both new and used

machinery. Capital sales include machinery, and quota. Breeding and replacement livestock are not accounted for in non-real estate capital purchases.

Cash for financial investments or withdrawal is calculated by subtracting net capital purchases from cash for investment or withdrawal.

Ratios

The **net change in current liabilities to cash uses** ratio is calculated as the net change in loans outstanding (current liabilities) divided by cash uses.

The **net change in long term liabilities to cash uses** ratio is the net change in loans outstanding (long term liabilities) divided by cash uses.

The **net change in loans outstanding to capital purchases** ratio is derived by dividing the net change in loans outstanding by total capital purchases.

The **loans outstanding to cash income** ratio equals the total figure for loans outstanding divided by cash income.

Note

Since 1995, the Farm Financial Survey includes farms with gross operating revenues equal to or over \$10,000. Prior to 1995, farms with gross operating revenues equal to or over \$2,000 were included in the sample.

SURVEY OF WAGE RATES FOR HIRED AGRICULTURAL LABOUR

Agriculture and Agri-Food Canada approached Statistics Canada in 1991 with a request to provide information on the level and movement of wage rates paid to hired farm labour. The results of a pilot survey in British Columbia in November of 1991 demonstrated that farm operators were willing to provide the necessary data. A survey program was set up to collect wage rates from farm operators beginning in November 1992 and ending in 1997. This survey was funded by Agriculture and Agri-Food Canada. All data in this series are on a calendar year basis.

The data are available in machine readable form through CANSIM in Matrix 160. For further information on CANSIM call (613) 951-8200 or your nearest regional office. Additional information regarding the results of this survey may be obtained from Rick Burroughs at (613) 951-2890 or FAX (613) 951-3868 or via the internet at rick.burroughs@statcan.ca.

Concepts and Methods

The Survey of Wage Rates for Hired Agricultural Labour is designed to provide estimates of average annual wage rates for hired agricultural labour by province/region and by type of work.

The **target population** is all farm operations employing hired agricultural labour. Labour provided by the spouse or children of the farm operator is excluded.

The **survey frame** is the 1991 Census of Agriculture, which provided a list of all farm operations reporting hired farm labour in 1990. Records from this list were stratified by province, type of farm, and size of farm. A sample of 3,000 farms was selected representing approximately 3% of the population.

This survey uses the computer assisted telephone interviewing (CATI) technique. The interviewer conducts a telephone interview with the respondent by asking questions and entering responses according to instructions on a computer screen. The computer program edits responses and ensures the completion of all steps in the process. A machine readable file is transferred directly to the survey processing operation.

Sample farm operators are asked to identify the jobs performed by hired labour and report for each job the wage rate, total wages paid and indicate if the job was year-round or seasonal. The interviewer codes each job according to one of six types of work.

The **data collection** file is reviewed in detail by subject matter experts to ensure that only appropriate information is passed to the calculation operation. The average wage rates are derived by calculating the implied time for each

job as the ratio of total wages to the wage rate and summing implied time and total wages over jobs by type of work and province/region. Each average is then the ratio of total wages to total time for that type of work and province/region.

Data Quality

A sample survey such as this one is subject to several types of error. **Coverage error** arises if the survey frame is not identical with the target population. In this case, the 1991 Census of Agriculture is considered an accurate indicator of farms reporting hired farm labour. Its quality will deteriorate with time. During the data collection, 3% of the sample farms were out of business or had changed operator.

The selection of a sample to represent the target population introduces sampling error. **Sampling error** is estimated using the coefficient of variation (CV) of the sample estimate. A CV of less than 10% is considered good; while a CV of over 25% is considered unreliable. A CV between these should be used with caution. The CV's in this survey vary considerably between estimates.

Non-sampling errors result from non-response, response error and processing error. Non-response occurs when the interviewer is unable to contact the respondent or the respondent refuses to cooperate. There is no action resulting from non-response in this survey. Response error occurs when the respondent provides an incorrect response. Processing error is the result of coding and keying errors by the interviewer. Response and processing error are controlled with the use of edits at the capture and processing stages and a review of each record by a subject matter expert.

The **response rate** is calculated as the percentage of usable records to the number of sample records still in business with the same operator. The overall response rate typically exceeds 95%.

Series discontinued

The series on wage rates for hired agricultural labour was discontinued in 1997.

AQUACULTURE

Aquaculture statistics - 2000

Aquaculture sales reached an all-time high in 2000 in the wake of increases in both production and a modest growth in product exports.

Canadian fish farmers sold a record \$691.3 million worth of product, up 11.2% from 1999, which was the slowest growth rate in the last three years.

One factor behind this slowdown in growth could have been an increase in imports of farmed salmon into both Canada and the United States, combined with declining prices.

The United States is Canada's top market for exports. Almost all Canadian finfish and shellfish exports go south of the border, with France, Japan and Taiwan taking the remainder. Exports expanded substantially during the 1990s, more than doubling between 1992 and 2000.

Finfish, mostly salmon, accounted for \$629.2 million in sales, 91.0% of the total, while molluscs accounted for \$54.7 million, or 7.9%. Finfish sales increased 10.4% from 1999, compared with 22.2% for molluscs.

Sales in New Brunswick are catching up to levels in British Columbia. These two provinces accounted for 83.6% of total national sales in 2000. In New Brunswick, sales rose 23.4% to \$281.9 million, while farmers in British Columbia, recorded sales of \$296.3 million, down 1.0%.

The largest rate of increase was in Nova Scotia, where revenues jumped 48.0%. Prince Edward Island fish farmers had \$27.8 million in mollusc sales in 2000, about half the national total from molluscs. This represented a 24.7% increase over 1999.

Production costs also went up, but at a slightly lower rate than revenues. Nationally, expenses, that is, the cost of products and services purchased from other businesses, excluding capital and labour costs, totalled \$473.7 million in 2000, up 9.4% from the previous year. Feed, which accounts for about 40% of total production costs, increased 6.7%.

In total, aquaculture farmers produced a gross output – including sales, subsidies and growth in inventories – of \$774.7 million in 2000, up 9.5% from 1999. Inventories of goods grew 5.4% to \$53.1 million as the industry expanded.

As a result, the gross value added by the industry to the Canadian economy – the difference between gross output and total product expenses – reached \$302.8 million in 2000, up 9.7% from the previous year.

Available on CANSIM: matrices 8500-8535

Data will be available in the updates to the *Livestock statistics* binder (23-603-UPE, \$45/\$149) or the *Agriculture economic statistics* binder (21-603-UPE, \$26/\$52). See *How to order products*.

For more information, or to enquire about the concepts, methods or data quality of this release, contact Tony Dupuis (613-951-2511, Tony.Dupuis@statcan.ca), or call the Agriculture Division at 1 800 465-1991.

Aquaculture: Value Added Account (1), by Province and Canada, 1997

	Nfld	P.E.I.	N.S.	N.B.	Que.	Ont.	B.C.	Canada (2)

Aquaculture Value Added Statistics

Concepts

The aquaculture value added account is designed to measure the economic production (value added) of goods and services from aquaculture establishments. Economic production can be defined as any process that creates value or adds value to existing goods. Consistent with this definition, the Canadian System of National Accounts defines economic production as the production of goods or services, which are exchanged for money in the marketplace.

Starting in 1997, the account displays the inputs and outputs (mostly revenues and expenses except for the change in inventory values) on a calendar year basis. These data are displayed by province, except for the Prairie Provinces where aquaculture is a relatively small industry. Gross value added at factor cost is residually derived by subtracting product inputs, or purchases from other businesses, from the gross output of the sector.

Aquaculture is the managed production of fish. In Canada, the industry is dominated by the production of finfish, primarily salmon off the coasts of British Columbia and New Brunswick. Production of shellfish is smaller with Prince Edward Island and British Columbia being the major producing provinces.

Under the North American Industrial Classification System (NAICS), this industry comprises establishments primarily engaged in farm-raising finfish, shellfish, or any other kind of aquatic animal. These establishments use some form of intervention in the rearing process to enhance production, such as keeping animals in captivity, regular stocking and feeding of animals, and protecting them from predators.

The aquaculture industry includes hatcheries and sales within the industry, for example, sales from a hatchery to a grow-out operation are included. The aquaculture industry does not include sport fishing or the wild fishery.

The estimates also include the costs and revenues derived from processing where it is an integral part of the establishment, but not the main activity or source of revenue.

Definitions

A business entity and an establishment

A business entity is an economic transactor having the responsibility and the authority to allocate resources in the production of goods and services.

A statistical establishment is one production entity or the smallest grouping of production entities which produces as homogeneous a set of goods and/or services as possible; which does not cross provincial boundaries; and for which records provide data on the value of output together with the cost of principal intermediate inputs used and cost and quantity of labour resources used to produce the output.

The population of interest

The population of interest is all establishments classified to aquaculture under NAICS 112510 and operating for at least one day during the reference year.

Financial variables

Operating revenues are generated from the sale of: whole fish (fresh or chilled); fish eggs or live fish for grow-out; live fish; whole fish dressed and frozen; fish fillets; fish that are dried, smoked or in brine; molluscs (oysters, mussels, clams, scallops;) and, seed or larvae for grow-out. Operating revenue may also include revenue from other sources such as real estate rental, consulting or government subsidies.

Non-operating revenues include income from interest or dividends.

Salaries and benefits include wages, salaries and benefits such as vacation pay, commissions or bonuses paid to employees as defined by Revenue Canada and requiring a T4 Supplementary Form. This item

includes the employer portion of employee benefits for items such as health care insurance plans, Canada Pension Plan contributions, or Employment Insurance premiums.

The processing services are the costs incurred when another company provides services related to gutting, cleaning, slitting, or shelling.

Other operating expenses include a long list of items such as: energy (electricity, gasoline, diesel, propane); water; transportation; rental and leasing; maintenance and repair; legal; accounting; consulting; veterinary; financial services; insurance; advertising; travel; property taxes; licenses; permits; office; management; and depreciation.

Non-operating expenses relate to interest expenses on loans or the interest component of a capital lease.

Methods

These data are produced as part of Statistics Canada's Unified Enterprise Survey (UES) conducted in 1997 for the first time. The survey incorporates several annual business surveys into an integrated survey. It aims to ensure Statistics Canada receives consistent and integrated data from many types of surveys and sizes of businesses, with enough detail to produce accurate provincial statistics.

Target population

The target population for this survey is: all establishments classified to aquaculture under NAICS 112510 that operated for at least one day during the reference year.

Frame and sample design

Two sources of data are used to derive the estimates:

a probability sample survey of aquaculture establishments with a gross business revenue greater than or equal to a cut-off that varied by province from \$30,000 to \$250,000.

taxation data are used to estimate for businesses with a gross business revenue less than the cut-off.

The frame that is used for the selection of the probability sample is Statistics Canada's Business Register. This list frame is updated and verified prior to sample selection. For 2000, the frame included 706 establishments classified to aquaculture.

Before a sample is taken, the records are stratified by province. Within each province, to improve the efficiency of the sample design, strata are defined using the gross revenue variable on the Business Register.

The "must-take" stratum contains the enterprises (with all its associated establishments) with revenue greater than or equal to \$25,000,000. All of these establishments are sent a questionnaire.

The "take-none" stratum contains the establishments with gross business revenue less than the cut-off. Data for these businesses are obtained from taxation data.

For the establishments not selected in the "must-take" (greater than \$25,000,000) or "take none" (less than the cut-off), three strata are defined to improve the efficiency of the sample design. There is a "take-all" stratum (all establishments are sent a questionnaire) and there are two "take-some" strata (a sample of establishments are selected and sent a questionnaire).

The overall sample size for 2000 was 169 establishments.

Data collection

In the spring, respondents selected in the questionnaire part of the sample were asked to report their fiscal year transactions. The fiscal year data are subsequently aligned to produce calendar year data using provincial level industry indicators.

The survey is conducted by mail along with Computer Assisted Telephone Interviews. These data are examined for inconsistencies and errors using automated edits coupled with an analytical review. Data for non-respondents and no-contacts are imputed, partially with the assistance of tax data.

Estimation design

The sampling weights derived from the sample design are modified and improved if necessary, using post stratification. This is possible because, during the passage of time since the sample was selected, the Business Register is updated further with more complete information.

Analysis of the estimates

The last step of the process is analytical. The financial picture for aquaculture is assessed within the context of other related production statistics available from provincial regulatory sources. Although the two sources measure different things, the provincial administrative data are valuable in the analysis to assist in the reduction of error and in confirming the accuracy of the estimates.

Data quality

All surveys are subject to sampling and non-sampling errors. Statistics Canada uses a variety of methods to minimize all types of errors. Measures of sampling error along with other indicators of quality are provided.

The coefficients of variation (CV), a measure of sampling error, are computed. The quality of the estimates are classified as: Excellent (CV is 0.01 to 4.99%); Very good (CV is 5.00% to 9.99%); Good (CV is 10.00% to 14.99%); Acceptable (CV is 15.00% to 24.99%); Use with caution (CV is 25.00% to 34.99%); and Unreliable (> 35.00%).

Using these ratings at the national level, the 2000 estimates are judged to be excellent, and at the provincial level, the estimates range from excellent to good. The estimates for New Brunswick and British Columbia, accounting for 83% of total operating revenue of aquaculture, are judged to be excellent.

Every effort is made to minimize the non-sampling error of omission, duplication, reporting and processing. When necessary, some records are imputed using information from tax files where possible.

For 2000, the response rates of the 169 sampled establishments receiving a questionnaire are: Completed: 49%; Refusal: 3%; Non-response (Non-response by survey deadline, Unable to locate, Change of Ownership, Amalgamation): 32%; Out-of-scope (Inactive, Out of Business, Duplicate, Out-of-scope): 16%. These response rates are considered normal for a business survey. The out-of-scope rate reflects the quality of the Business Register at the time of sampling. Of the original sample, 32% required imputation to complete the estimates. Reasons for imputation include partial response, failure to respond before the survey deadline, refusals, and inability to contact the respondent.

Finally, the aquaculture estimates were compared to and found to be consistent with administrative data sources obtained from the provinces, reinforcing confidence in the quality of the aquaculture statistics. All of the data are reviewed for accuracy and consistency and provide a reliable portrait of the aquaculture industry.

The first part of the report deals with the general situation of the country. It is a very interesting and informative study of the country's development. The second part of the report deals with the specific details of the country's development. It is a very detailed and informative study of the country's development.
